In both adolescents and adults, research has found that sexual and gender minorities are more likely to engage in risky behaviors than their heterosexual and/or cisgender peers. Policies and cultural norms that stigmatize and exclude sexual and gender minorities can foster these behaviors and ultimately lead to negative health effects for individuals and population health disparities specific to these communities. It is of the utmost importance to understand and address the unique health needs of sexual and gender minorities.

For the first time, the Chicago Department of Public Health (CDPH) is presenting data to describe sexual and gender minority health status for lesbian, gay or bisexual (LGB) youth, LGB adults and transgender adults in Chicago. These new data are critical as stakeholders continue to implement the citywide health improvement plan, Healthy Chicago 2.0, launched in 2016. Sexual and gender minorities are identified as a priority population for several overall goals of the plan.

Data from the CDC Youth Risk Behavior Survey (YRBS) and the CDPH Healthy Chicago Survey (HCS) provide local information on a wide range of health issues among LGB youth and adults. In this document, easy-to-read charts and tables are provided to glean differences or similarities between (1) males and females who identify as LGB compared to their heterosexual peers, (2) between males and females who identify as LGB and (3) between LGB and heterosexual identified individuals overall.

Importantly, HCS data are able to describe a limited number of broad health outcomes comparing the health of transgender adults to their cisgender peers. Small numbers of transgender respondents to the HCS survey limit our ability to report on the array of indicators that are included for LGB in this report. We acknowledge that the transgender data presented in this report are a modest start towards a true understanding of the needs of the transgender population. CDPH remains committed to serving transgender and gender non-conforming residents and will continued to work with our partners to identify new resources to conduct more inclusive research on the transgender and gender non-conforming populations of Chicago.

Among the most important milestones of this report are the first-ever population estimates and demographic profile of the overall LGBT population in Chicago. Almost 146,000 (7.5%) of Chicago adults identify as LGBT. These long sought after numbers provide a new perspective on the scope and contribution of the LGBT community to Chicago as a whole.

Key findings of this report emphasize both promising resiliency and the challenges that remain in achieving health equity.

- Older LGB and older heterosexuals report similar levels of overall well being to each other. This is in contrast to differences that exist among young adults in both groups.
- Similarly, older LGB adults are far less likely to report psychological distress than younger adults.
- Lesbian and bisexual females are more likely to be current smokers than heterosexual females at all life stages.
- Male gay and bisexual youth report alarmingly high rates of substance use, particularly heroin and prescription drugs.
- Transgender and gender non-conforming adults are less likely to report good overall health and far more likely to report psychological distress than their cisgender peers.

While LGB youth do exhibit higher rates of health risk behaviors than their heterosexual peers for many indicators, the differences do not persist strongly into adulthood. These particular findings may reflect a resilient effect among many in the sexual minority communities in the face of stigma and social exclusion. Continuing efforts to promote health and well-being among transgender persons must be combined with policies and actions to sharply reduce the social and economic hardships they face.
# Table of Contents

## Introduction
- 08 Population Estimates
- 10 Healthy Chicago 2.0
- 12 Data Sources
- 14 How to read this report

## Transgender Health
- 18 Transgender Health

## LGB Health
### Demographics
- 22 Youth
- 24 Adults, aged 18-44 years
- 26 Adults, aged 45+ years

### Access to Care
- 28 Youth
  - Dentist visit in past year
  - Wellness visit in past year
- Adult
  - Personal health care provider
  - Routine check-up in past year
  - Health care satisfaction
  - Access to mental health treatment
  - Ever had an HIV test
  - Pap test in past three years
  - Mammogram in past two years
  - Colorectal cancer screening

## Behavioral Health
### Youth
- Felt sad or hopeless for 2+ weeks
- Participation in a sports team
- Disordered eating
- Suicide attempt resulting in injury
- Underage drinking
- Underage binge drinking
- Marijuana use
- Drug use and prescription drug misuse
- Electronic bullying
- Missed school due to a safety concern
- Fight on school property
- Bullied on school property
- Harassed because of perceived sexual orientation
- Physically forced to have sex
### Adult
- Self-rated health status
- Psychological distress
- Binge drinking

## Access to fresh produce

## No physical activity in past month

## Obesity

## Hypertension

## Diabetes

## Asthma

## Sexual Behavior
### Youth
- Ever had oral sex
- Ever had sex
- One or more sexual partners in the past month
- Four or more lifetime sexual partners
- Sex of sex partners
- Condom use
- Drug or alcohol use prior to sex
### Adult
- Sex of sex partners

## Chronic Disease
### Youth
- Youth smoking
- Fruit and vegetable consumption
- No sustained physical activity
- Obesity
- Asthma
### Adult
- Current smoking
- Quit attempt in past year
- Ever tried e-cigarettes
- Fruit and vegetable consumption

- 79 Youth
- 84 Adults, aged 18-44 years
- 87 Adults, aged 45+ years
Introduction
Introduction

Individuals pass through several life stages, each with their own biological, psychological and social advantages and challenges. In this report, the Chicago Department of Public Health (CDPH) presents, for the first time, data on the overall health of Chicago residents who identify as lesbian, gay and bisexual (LGB) with a focus on three life stages—youth, young adult and older adult—and adults who identify as transgender. The goal of this report is to cover a wide range of health topics that complement existing and ongoing CDPH activities, such as HIV/STI surveillance, whose data are available through separate reports.1,2

Two surveys serve as the data sources for this report. The CDC Youth Risk Behavior Survey (YRBS) is a self-administered survey given to randomly selected Chicago Public Schools 9th–12th grade students. The CDPH Healthy Chicago Survey (HCS) is a random digit dialed telephone survey for adults aged 18 and over. Both surveys ask a range of health status and behavior questions. Using these data, CDPH is able to look at an array of metrics for LGB health to compare with the health of heterosexuals in Chicago. HCS also allows respondents to report their transgender identity. A section of this report has been dedicated to looking at a limited number of health outcomes comparing transgender persons to their cisgender peers. The small numbers of transgender respondents to the HCS survey prevent reliable reporting of results on the wide range of measures contained in the survey.

HCS data have enabled CDPH to report population estimates and a demographic profile for LGBT adults for the first time (Table 1). There are approximately 146,000 adults in Chicago who identify as LGBT, about 7.5% of the city’s adult population. Of these, 138,000 identify as LGB (7.1%) and 10,500 identify as transgender (0.5%), although these groups are not mutually exclusive.

</table>
Though CDPH recognizes that sexual identity is a spectrum, the surveys’ methodologies limited the categorization of individuals to those who identified as gay, lesbian and bisexual. In an effort to maximize our reporting, individuals who identified as bisexual are included within lesbian and gay categories, although we acknowledge potential differences from their lesbian and gay peers.

CDPH also acknowledges that there is a dearth of reliable surveillance data for transgender residents. While the data in this report provides some understanding, they are limited. CDPH is committed to finding additional resources and opportunities to survey Chicago’s transgender residents to better understand the community’s needs.

Local and national groups are acknowledging the unique health needs of sexual and gender minority populations. Chicago Public Schools guidelines and the City of Chicago Human Rights Ordinance both aim to prevent discrimination based on gender identity. CDPH’s LGBT Community Action Plan and Healthy Chicago 2.0 outline priorities to address for the lesbian, gay, bisexual, transgender and queer (LGBTQ) communities. The National Institutes of Health (NIH) has a Sexual and Gender Minority Research Office that coordinates sexual minority related research and activities. Healthy People 2020 has identified Lesbian, Gay, Bisexual and Transgender health as a priority. However, even with these activities, there is more work to be done in elucidating the assets and challenges that exist in sexual minority communities. We view this report as an important step forward.

References

Healthy Chicago 2.0

In 2016, Mayor Rahm Emanuel and CDPH launched Healthy Chicago 2.0, a plan developed in collaboration with the Partnership for Healthy Chicago and over 200 stakeholders to improve the health and well-being of Chicago’s residents over the next four years. The goals, objectives and action steps in the plan were developed to achieve our vision of “a city with strong communities and collaborative stakeholders, where all residents enjoy equitable access to resources, opportunities and environments that maximize their health and well-being.”

LGBTQ Objectives

Stakeholders used data from a comprehensive community assessment process that included focus groups, oral histories, surveys and surveillance to determine areas of highest needs. From this process, stakeholders determined LGBTQ youth are especially vulnerable and developed the following objectives and action steps to improve health equity for this population.

OBJECTIVE: Increase school attendance among homeless and LGBTQ youth to the district-wide attendance rate of 93%

STRATEGIES:
- Create a more robust data collection mechanism to inform practice for the LGBTQ community
- Partner with CPS to increase training for teachers, administrators and other school personnel on diversity, inclusion and trauma
- Promote and support Gay Straight Alliances at schools and other youth-serving organizations

OBJECTIVE: Reduce suicide attempts among LGBTQ youth by 10%

STRATEGIES:
- Promote Social Emotional Learning (SEL) programming in K-12 schools
- Employ technology innovations to increase youth access to support and behavioral health treatment, e.g. crisis text line program, behavioral health screening and referral web application
- Expand the delivery of behavioral health services through community mental health partnerships in schools

OBJECTIVE: Decrease bullying of LGBTQ high school students by 10%

STRATEGIES:
- Implement evidence-based, school-based interventions that focus on bullying prevention, teen dating violence prevention, Early Intervention and on enhancing positive peer relationships in CPS
Data Sources

The Youth Risk Behavior Survey

The Youth Risk Behavior Survey (YRBS) is administered in odd numbered years to 9–12th graders in Chicago Public Schools (CPS). The survey uses a two-stage cluster sample design to produce a representative sample of students within the jurisdiction. The first stage involves selecting schools with a probability proportionate to their population size. The second stage randomly selects classes or periods within a school. This enables data from the survey respondents to be weighted to represent the CPS student body. The survey itself is self-administered and only available in English. A question was added in 2003 asking students about their sexual identity:

Which of the following best describes you?

A. Heterosexual (straight)
B. Gay or lesbian
C. Bisexual
D. Not Sure

For the purpose of this report, students who answered “Not Sure” were excluded from analysis due to insufficient information required for categorization. To increase sample size, responses were pooled for several of the most recent years. However, because the same questions are not asked every year, not all questions are available for all years. Question responses include data for 2009–2013, 2011–2013 or 2013 alone as available; included years are indicated on each chart and in the data tables at the end of the report.

As of the 2013 survey, gender identity, whether students identify as cisgender, transgender or gender non-conforming, is not available from YRBS.

Healthy Chicago Survey

The adult data in this report were collected through the Healthy Chicago Survey (HCS), an annual telephone survey of adults conducted by CDPH. It is conducted to collect information on the population’s health status, health access patterns, disease and risk factor prevalence and health behaviors. CDPH relies on the HCS as a key resource for monitoring the health of Chicago’s adult population.

The HCS is a cross-sectional telephone survey with an annual sample of approximately 2,500 randomly selected adults aged 18 and older who live in private residences in the city of Chicago. Individuals who are homeless or who live in group residences, for example prisons, senior living centers or college dormitories are not included in this survey. Participants are able to complete the survey via landline or cell phone and interviews are conducted in English and Spanish. All data collected are self-reported.

For this report, data from the 2014 (n=2,517), 2015 (n=2,406) and 2016 (n=2,726) waves of data collection were pooled together in order to increase sample size and improve statistical reliability. Data are weighted to be representative of Chicago’s adult population.

Gender identity is captured in the HCS by asking respondents to self-identify as transgender or gender non-conforming. Due to small numbers, those who identify as transgender and gender non-conforming are grouped in this report.

Sexual orientation is captured in the HCS by asking respondents to self-identify as straight, lesbian or gay or bisexual. Respondents are also given the opportunity to specify their identity via an open text field and these responses were grouped into ‘something else or other.’ Because this report focuses on those identifying as lesbian, gay or bisexual (LGB), those who responded with ‘something else’ or ‘other’
Lesbian, Gay, Bisexual and Transgender Health

were treated as missing for all analyses in this report. Those who responded with “don’t know” and those who refused to answer this question were also treated as missing.

Do you consider yourself to be:

1. Straight
2. Lesbian or gay
3. Bisexual
4. Other (specify)

Do you consider yourself to be transgender?
If yes,
Do you consider yourself to be male-to-female, female-to-male, or gender non-conforming?

1. Yes, Transgender, male-to-female
2. Yes, Transgender, female-to-male
3. Yes, Transgender, gender non-conforming
4. No

Throughout the report, overall and sex-specific prevalence estimates are reported, comparing gay or bisexual men to heterosexual men and lesbian or bisexual women to heterosexual women. Data have been stratified into two age groups: young adults aged 18–44 years and older adults aged 45 years and older, to represent health needs at different life stages.

How to read this report

When using the data in this report, keep in mind the following guidance:

Demographic Tables

Tables present the actual number of people who responded and the weighted percentage. The weighted percentage is an adjusted statistic that takes into account the respondent relative to the survey population.

Youth: Those who answered ‘not sure’ are reported to give a picture of how they compare to other groups. These students, however, are excluded from analysis used for the charts.

Adults: Adults are divided into two groups, ages 18-44 and 45+

Data Tables

Data are weighted percentages and associated confidence intervals.

Tables show the survey question used for each indicator, the data source and the year of the data. Point estimates and 95% confidence intervals are presented. Colored boxes indicate significant difference between LGB and Heterosexual based on non-overlapping 95% confidence intervals.

Charts

Data are weighted percentages and associated confidence intervals.

Summary statements for each indicator describe the results shown in the graphs. There are separate indicators for youth and adults, with adults divided into ages 18-44 and 45+ unless otherwise noted. Each indicator is grouped by gender and total unless otherwise noted, with different colored bars representing sexual identity.

Gender: Results are shown based on whether an individual selected male or female.

Sexual identity: Respondents who reported that they identified as lesbian, gay or bisexual are categorized as LGB. Those who identified as straight or heterosexual are categorized as Heterosexual. Those who answered ‘not sure” (YRBS) or ‘something else’ or ‘other’ (HCS) were excluded from analysis.

Data Source

There is a statistically significant difference between LGB and Heterosexual because the 95% confidence interval error bars do not overlap.
Transgender Health
Transgender Health

Chicago’s transgender and gender non-conforming people in Chicago have unique health needs and experiences. However, historically, a lack of local data has made it difficult to comprehensively describe and understand these needs.

Since 2014, the Healthy Chicago Survey (HCS) has collected information on the gender identity of adults living in Chicago. The use of a telephone survey targeting the entire population of Chicago presents great limitations in reaching the transgender adult population. CDPH recognizes this limitation and is committed to identifying resources and opportunities to develop innovative ways of collecting more robust health data for transgender residents.

The pooled 2014–2016 HCS dataset used for this report included 45 adults that identified as transgender or gender non-conforming. Though CDPH believes in the importance of sharing these data, we suggest interpreting the results of this section with caution due to small numbers.

Based on HCS data we estimate that there are approximately 10,500 transgender or gender non-conforming adults living in Chicago, representing 0.5% of the adult population. This estimate is similar to estimates produced for Illinois (0.51%) and the US overall (0.58%)¹.

Note: n values are unweighted. Percentages are weighted to be representative of Chicago's adult population.
Chicago transgender and gender non-conforming adults are less likely to report wellness and more likely to report psychological distress than their cisgender peers (Figures 1 and 2). National data from the 2015 U.S. Transgender Survey reports that 78% of transgender adults said their health was excellent, very good or good compared to 82% for the general population and 39% of transgender adults reported serious psychological distress. Transgender individuals are more likely to experience discrimination, harassment, violence, economic hardship which all impact physical and emotional health.

**Figure 1**  Adults aged 18 years or older who identify as transgender or gender non-conforming are significantly less likely to report their health as excellent, very good or good.

**Figure 2**  Adults aged 18 years or older who identify as transgender or gender non-conforming are significantly more likely to have experienced psychological distress in the past month.

Access to Care

Access to health care is important for both individual and community health. Health insurance helps individuals access needed treatment and preventative services, but insurance alone is not enough to ensure full access to care. Access encompasses several components: availability of services, affordability and appropriate, effective and equitable care. If all of these factors are not in place, individuals may be less likely to seek the care they need.

Those who identify as LGB have faced and continue to face structural barriers to accessing adequate health care. Before the landmark Obergefell v. Hodges Supreme Court ruling that legalized same-sex marriage throughout the US, many same-sex couples faced barriers to accessing their partner’s employer-sponsored health insurance. Also, if health care providers are not trained in LGB-specific health issues, LGB adults and youth may feel apprehension about seeking care due to fear of discrimination, dissatisfaction with services and/or anticipation of a negative experience. While specialized health centers that address the needs of LGB youth do exist, most receive services from the same providers as non-LGB youth and only 16% of LGB youth are out to their doctor. Finally, both LGB adults and youth may face additional intersecting barriers to care faced by other socio-demographic groups (e.g. gender, race/ethnicity, poverty level, homeless).

Research findings are mixed when it comes to understanding how and if these barriers lead to decreased utilization of health services among LGB adults and youth. Lesbian women are more likely than heterosexual women to be uninsured, delay medical care due to cost and have no usual source of medical care. Lesbian women are also less likely to have had or receive the results of a Pap test and are less likely to undergo mammography. Gay men are more likely to delay medical care due to cost and report having trouble finding a provider when they need care. However, gay men are also more likely to meet colorectal cancer screening guidelines and to have had an HIV test. The most recent US data from the Youth Risk Behavior Survey (YRBS) suggests that LGB youth utilize health services at lower rates than non-LGB youth. For example, the prevalence of having seen a dentist was higher among heterosexual students (75.6%) than LGB students (66.0%).

To address barriers and improve health care access for LGB individuals, national institutions including the Institute of Medicine and the American Academy of Pediatrics have called for training health care providers and office staff in LGB-specific health needs, ensuring that heterosexuality is not presumed and creating offices that are welcoming to all. Healthy Chicago 2.0 aims to improve all aspects of access, including expanding insurance coverage and improving the quality of health and human services.

Behavioral Health

Behavioral health encompasses mental and emotional health and freedom from substance use disorders and addiction. Violence is inexorably linked to behavioral health—trauma from experienced violence can have a lifelong impact on one’s emotional well-being and contribute to substance use disorders and chronic health conditions.¹ Many sexual minority individuals experience not only overt homophobia, discrimination and violence, but also the chronic stress of social stigmatization, determining whether to reveal one’s sexual orientation, altering behavior to adjust to a social norm and lack of support and helping resources.² It is not surprising, then, that research generally reports worse outcomes and experiences for sexual minority youth and adults around mental health, substance use and misuse and violence when compared to their heterosexual peers.

Serious psychological distress potentially impairs an individual’s ability to function socially, at work or at school. Adult women are more likely than adult men to experience serious psychological distress; rates of serious psychological distress are higher among people with lower incomes.³ When compared to their heterosexual counterparts, gay and bisexual men and bisexual women are more likely to report severe psychological distress and lesbians are more likely to report moderate psychological distress.⁴ LGBT youth who experience victimization over time are more likely than those that do not to experience post traumatic stress disorder and depression.⁵ Another measure of mental health, suicidal ideation, is also higher among sexual minority youth, although there are differences in race/ethnicity.⁶ Females are more likely to report suicidal ideation and attempts. Sexual minority youth are also more likely to report suicide risk factors including alcohol abuse, depression, having a family member or friend who attempted suicide and victimization.⁷ Healthy Chicago 2.0 identified sexual minority youth as a priority population for mental health, with an objective of reducing suicide attempts resulting in injury among LGBTQ youth.⁸

Disordered eating is extreme dieting behavior, including fasting, the use of diet pills or laxatives and self induced vomiting and binge eating. How frequently a person diets has been linked to higher stress levels, higher rates of alcohol and tobacco use, more suicidal ideation and attempts, increased delinquent behaviors and increased past physical and sexual abuse. Disordered eating behavior is found to be more prevalent in females and peaks during puberty.⁹ National data indicate that sexual minority youth are more likely to engage in disordered eating practices than heterosexual youth among both males and females and between race/ethnicity groups.¹⁰ The National Survey on Drug Use and Health (NSDUH) estimates that in 2014 approximately 10.2% of Americans over age 12 used illicit drugs within the past month and 23.0% engaged in binge drinking in the past month.¹¹ Substance misuse can have detrimental effects on a person’s quality of life, affecting productivity, physical and mental health and life expectancy.¹² Several studies have shown that both youth and adult sexual minorities are at increased risk for substance misuse compared to the sexual majority.¹³–¹⁴ However, even among
sexual minority subpopulations, differences exist. For example, lesbians and bisexual women may be more likely to misuse alcohol and gay men more likely to misuse drugs while individuals who identify as bisexual exhibit higher substance misuse than exclusively heterosexual or homosexual individuals.\textsuperscript{15} Even though substance use and misuse within the sexual minority community has been identified as an issue, very few agencies, 7.4% according to one study, offer treatment services tailored to sexual minorities.\textsuperscript{16}

The National Intimate Partner and Sexual Violence Survey (NISVS) found that approximately 13% of lesbian women, 46% of bisexual women and 17% of heterosexual women have been raped in their lifetime. Nearly half (48%) of bisexual women who are raped experience the rape between age 11 and 17. The same survey also found that 40% of gay men, 47% of bisexual men and 21% of heterosexual men have experienced sexual violence other than rape in their lifetime.\textsuperscript{17} Sexual assault victimization has been linked to high risk sexual behaviors, mood disorders including depression and suicide attempts.\textsuperscript{18} While our survey data only allow us to measure sexual violence among LGB youth, this is an issue that affects sexual minority men and women throughout their lives.

For youth, school connectedness can have a great influence on emotional health and academic achievement. When youth feel connected to their school community, there is evidence that they exhibit less disruptive behavior and emotional distress, experience less school violence, engage in less substance and tobacco use and have older sexual debut.\textsuperscript{19} There is little research on whether this pattern holds for sexual minority youth and in fact many sexual minority youth do not feel that school is a safe, welcoming place. The 2013 National School Climate Survey done by GLSEN (Gay, Lesbian & Straight Education Network) reports that 55.5% of sexual minority students felt unsafe at school because of their sexual orientation and 61.2% avoid extracurricular activities because they feel unsafe or uncomfortable.\textsuperscript{20}

While the Human Rights Campaign Youth Survey found that sexual minority youth were as likely to participate in after school activities such as debate, band or academic clubs as their heterosexual peers (63% vs 63%), sexual minority youth were less likely to participate in sports, 30% vs. 49%.\textsuperscript{21} Out on the Fields found that 73% of respondents felt like youth sports were not safe or welcoming for LGB youth.\textsuperscript{22} Gay-Straight Alliances (GSAs), clubs that provide safe spaces for sexual minority youth and their allies, have been shown to improve school connectedness and are perceived to represent safety for sexual minority youth as well as being a welcoming community and a gateway to resources.\textsuperscript{23} In this report, YRBS questions around bullying and fighting on school property, missing school due to safety concerns and participation in school sports measure school connectedness.

Chronic Disease

Chronic diseases and conditions, including heart disease, stroke, cancer, diabetes and obesity are among the most common, costly and preventable of all health problems in Chicago. Though hospitalizations and deaths due to chronic diseases have decreased in Chicago over time, inequities persist for many groups due to differences in behaviors like diet and physical activity and in upstream root causes, like economic stability, built environment, education and social and community context. Healthy Chicago 2.0 commits to policies making healthy lifestyles easier, safer, cheaper and more convenient in order to address inequities in chronic disease.

It is well documented that sexual minority populations in the United States have elevated rates of many chronic conditions: in particular, sexual minority youth and lesbian and bisexual women have disproportionately high rates of obesity. Conversely, compared with heterosexual men, gay men are less likely to be obese or overweight. Some evidence suggests that the weight disparity between sexual orientation groups may begin at an early age. A large cohort study of adolescents found that sexual minority girls had consistently increased BMI throughout adolescence compared with heterosexual girls, whereas sexual minority boys had decreased BMI in late adolescence compared with heterosexual boys.7

While inequities in obesity among sexual minority populations are well documented, less is known about the reasons why. There are few studies that have examined inequities in physical activity and diet among sexual minorities and results from these studies yield inconsistent findings. While some studies have indicated that sexual minority subgroups report lower levels of physical activity and consumption of fruits and vegetables, in others, no differences were found. When studies have sample sizes large enough to assess sexual minority women separately from men, it has been found that lesbian and bisexual women report lower daily vegetable consumption and higher consumption of sugar sweetened beverages than heterosexual women. This could partly be due to lesbian and bisexual women reporting less availability of fresh fruits and vegetables in their neighborhoods and homes. Youth data show no clear pattern of differences by sexual identity for dietary behaviors, though sexual minority youth are less likely to engage in physical activity.4

Cigarette use is associated with several chronic health conditions. Male and female LGB adults are more likely to be current smokers than their heterosexual peers. Youth data show a similar trend, with LGB youth more likely to have ever tried smoking (50.4%) than heterosexual youth (30.5%). Nineteen percent of LGB youth are current smokers versus only 9.8% of heterosexual youth.7

Sexual Behavior

Just under half of high school students, 41.2%, report having had sexual intercourse. More LGB students report having had sexual intercourse (50.8%) than heterosexual students (40.9%). Sexual activity can have unintended health outcomes, such as unintended pregnancy and sexually transmitted infections (STIs), especially for youth, who may be unaware of the consequences. In Chicago in 2015, youth aged 13-24 years accounted for approximately 55.8% of gonorrhea cases and 63.0% of chlamydia cases; persons aged 13-24 accounted for 28.0% of new HIV diagnosis. Youth who have a positive outlook on their future are less likely to engage in risky sexual behavior, maintain healthier sexual behaviors and have higher levels of sexual knowledge.

Parents are an important resource for teens when learning about sex. For younger adolescents, parents are the main influencer, with friends becoming more important as teens grow older. Approximately 79% of females and 70% of males aged 15-19 reported speaking to their parents about sex education topics. Most teens—96% of females and 97% of males—report receiving some form of formal sex education before age 18. Instruction for most students addresses abstinence, birth control and instruction on STIs and HIV/AIDS. However, if sexual minority youth do not feel comfortable talking to parents or instructors about sex, then they are potentially missing out on valuable information. Human Rights Campaign found that 29% of sexual minority youth did not have an adult they felt they could talk to about personal problems and 49% did not have an adult in their family that they could turn to for help if they felt worried or sad. This lack of support could also mean that messaging around less risky sexual behavior is not being addressed with sexual minority youth.

Healthy Chicago Survey: 2015

**Pap test in past three years:**

A Pap test is a test for cancer of the cervix. Have you ever had a Pap test? How long has it been since your last Pap test? Excludes those who have had a hysterectomy. Only includes women aged 45-65 years.

<table>
<thead>
<tr>
