What is the risk?
CDPH’s influenza surveillance systems indicate that the risk for acquiring influenza infections is high throughout Chicago and the majority of infections are due to the influenza A (H1N1) pdm09 strain, which is included in all 2013-2014 influenza vaccines. Vaccination is the best way to protect against influenza infection and all Chicagoans aged six months and older are encouraged to get vaccinated. Some children 6 months through 8 years1 of age require two doses of influenza vaccine. Chicagoans should ask their healthcare provider or pharmacist about vaccine availability. For those without a healthcare provider or whose healthcare providers do not have the influenza vaccine, call 311 or go to www.chicagoflushots.org to locate the closest City of Chicago clinic or retail pharmacy. CDC recommends2 antiviral treatment as early as possible for any patient with confirmed or suspected influenza who is hospitalized, has severe illness or is at higher risk for serious complications.

Are severe cases of influenza occurring?
The Illinois Department of Public Health (IDPH) has issued influenza testing and reporting guidance3. Suspected novel and variant influenza, pediatric influenza-associated deaths, influenza-associated ICU hospitalizations and outbreaks of influenza-like illness in a congregate setting should all be reported to CDPH via I-NEDSS4. For the week of January 5-11, 2014 (week 2), 37 influenza-associated ICU hospitalizations were reported; 36 were positive for influenza A (20 [H1N1]pdm09 and 16 unknown subtype [subtyping not attempted or not all subtypes tested]) and 1 was positive for influenza B. This week last season, there were 13 reported ICU hospitalizations.

Since September 29, 2013, 108 influenza-associated ICU hospitalizations have been reported (Figure 1). Among the total ICU hospitalizations reported 105 were positive for influenza A (50 [H1N1]pdm09 and 55 unknown subtype) and 3 was positive for influenza B. Fifty-six (52%) were female, 65 (60%) were 50 years of age or older, and 7 (6.5%) were 4 years of age or younger (median age of 55.5 years with a range of 4 months-86 years). Fifty-one (47%) were Black, 41 (38%) had lung disease (including asthma) and 40 (37%) required ventilator support. Eight deaths have been reported among the total ICU hospitalizations.

How much influenza-like illness is occurring?
CDPH receives data from over 50 surveillance sites across Chicago, which report the total number of patient visits seen weekly, and of those visits, the number with influenza-like illness (ILI) (i.e., fever of 100°F or greater, with cough or sore throat). All hospitals in Chicago that provide emergent care are required to report on a weekly basis the total number of emergency department visits, and of those visits, the number with ILI. For the week of January 5-11, 2014, with 15 hospitals reporting, 4.8% of emergency department visits were due to ILI. (Figure 2).
ESSENCE is an electronic syndromic surveillance system that utilizes emergency department chief complaint data submitted daily by participating Chicago hospitals. ILI activity is determined solely based on the patient’s chief complaint and does not take into account the entire medical record, as the ILI activity reported in Figure 2 does.

Currently, 9 Chicago hospitals submit data to ESSENCE. Figure 3 shows the percent of the total emergency department visits due to ILI for pediatric patients (4.2%) and adult patients (3.5%) for the week of January 5-11, 2014 plus the ILI activity by age group for the previous season.

Several outpatient clinics and hospital emergency departments throughout Chicago participate in CDC’s Influenza-like Illness Surveillance Network (ILINet) by reporting on the number of patients with ILI seen weekly. From January 5-11, 2014, with 55 facilities reporting, 4.2% of outpatient visits were due to influenza-like illness. Currently, ILI activity is more than one percentage point lower than levels seen during the same week last season (Figure 4).

Which influenza strains are circulating? Data on influenza virus test results are reported by Chicago laboratories performing influenza subtyping. For the week of January 5-11, 2014, with 6 laboratories reporting, 159 of the 940 (16.9%) specimens tested for influenza were positive. This week last season, 20.2% of specimens tested were positive for influenza. Among this week’s positive specimens, 158 were typed as influenza A (126 [H1N1]pdm09, 3 H3N2 and 29 unknown subtype) and 1 was typed as influenza B (Figure 5). Since September 29, 2013, 569 of 6606 (8.6%) specimens tested for influenza have been positive; 556 typed as influenza A (379 [H1N1]pdm09, 9 H3N2, and 168 unknown subtype) and 13 typed as influenza B.

Where can I get more information? The Centers for Disease Control and Prevention’s FluView report provides national updates and trends related to the intensity of influenza activity across the United States, as well as detailed information on antiviral resistance, severity of illness, and other topics. Updates specific to Illinois and Suburban Cook County are also available online. Current and archived issues of the Chicago Flu Update can be found on the CDPH website section Current Flu Situation in Chicago. The Metropolitan Chicago Healthcare Council (MCHC) and CDPH recently released “Stop the Spread: A Health Care Guide to Influenza Preparedness”. This report provides an overview of influenza, its impact on public health and how hospitals can prepare for, mitigate the impact of and respond to influenza infections and outbreaks.
