What is the risk?
Currently, the risk of influenza infection is low. The week of December 8th through 14th is Vaccinate Illinois Week. Please join CDPH and partners throughout the state as we remind healthcare providers and the public that it is not too late to give or get a flu shot. For those without a healthcare provider or whose healthcare providers do not have the influenza vaccine, a schedule of City of Chicago influenza vaccine clinics is available on the City website and by calling 311. To locate the closest City of Chicago clinic or retail pharmacy, go to www.chicagoflushots.org. For a list of other Vaccinate Illinois Week activities, go to www.cityofchicago.org/flu.

As part of Vaccinate Illinois Week, the Illinois Chapter of the American Academy of Pediatrics will be hosting an update on influenza activity by CDC influenza expert Dr. Lyn Finelli on Wednesday, 12/10/2013 from 12N to 1PM. A limited number of spaces are still available for this webinar. Please register at https://www4.gotomeeting.com/register/905120375.

Are severe cases of influenza occurring?
The Illinois Department of Public Health (IDPH) has issued influenza testing and reporting guidance. Suspected novel and variant influenza, pediatric influenza-associated deaths, influenza-associated ICU hospitalizations and outbreaks of influenza-like illness in a congregate setting should all be reported to CDPH via INEDSS. For the week of November 24-30, 2013 (week 48), 1 influenza-associated ICU hospitalizations was reported; positive for influenza A (H1N1). This week last season, there were 9 reported ICU hospitalizations.

Since September 29, 2013, 5 influenza-associated ICU hospitalizations have been reported (Figure 1). Among the total ICU hospitalizations reported all were positive for influenza A (3 not subtyped and 2 H1N1). Three (60%) were female, two (40%) were NH-White, and four (80%) were 50 years of age or older (median age of 62 years with a range of 49-83 years). Four (80%) had lung disease (including asthma) and two (40%) required ventilator support. No deaths have been reported.

How much influenza-like illness is occurring?
CDPH receives data from over 50 surveillance sites across Chicago, which report the total number of patient visits seen weekly, and of those visits, the number with influenza-like illness (ILI) (i.e., fever of 100°F or greater, with cough or sore throat). All hospitals in Chicago that provide emergent care are required to report on a weekly basis the total number of emergency department visits, and of those visits, the number with ILI. For the week of November 24-30, 2013, with 14 hospitals reporting, 2.8% of emergency department visits were due to ILI. Currently, ILI activity is similar to levels seen during the same period of the past three influenza seasons (Figure 2).
ESSENCE is an electronic syndromic surveillance system that utilizes emergency department chief complaint data submitted daily by participating Chicago hospitals. ILI activity is determined solely based on the patient’s chief complaint and does not take into account the entire medical record, as the ILI activity reported in Figure 2 does.

Currently, 9 Chicago hospitals submit data to ESSENCE. **Figure 3** shows the percent of the total emergency department visits due to ILI for pediatric patients (2.6%) and adult patients (1.7%) for the week of November 24-30, 2013 plus the ILI activity by age group for the previous season.

Several outpatient clinics and hospital emergency departments throughout Chicago participate in CDC’s Influenza-like Illness Surveillance Network (ILINet) by reporting on the number of patients with ILI seen weekly. From November 24-30, 2013, with 46 facilities reporting, 3.4% of outpatient visits were due to influenza-like illness (**Figure 4**).

**Which influenza strains are circulating?**

Data on influenza virus test results are reported by Chicago laboratories performing influenza subtyping. For the week of November 24-30, 2013, with 6 laboratories reporting, 8 of the 337 (2.4%) specimens tested for influenza were positive. This week last season, 5.8% of specimens tested were positive for influenza. Among this week’s positive specimens, all were typed as influenza A (5 H1N1 and 3 were not subtyped) (**Figure 5**). Since September 29, 2013, 30 of 2,959 (1.0%) tested for influenza have been positive; 28 typed as influenza A (16 H1N1, 1 H3N2, and 11 were not subtyped) and 2 typed as influenza B.

**Where can I get more information?**

The Centers for Disease Control and Prevention’s FluView website provides national updates and trends related to the intensity of influenza activity across the United States, as well as detailed information on antiviral resistance, severity of illness, and other topics. Updates specific to Illinois and Suburban Cook County are also available online. Current and archived issues of the Chicago Flu Update can be found on the CDPH website section Current Flu Situation in Chicago. The Metropolitan Chicago Healthcare Council (MCHC) and CDPH recently released “Stop the Spread: A Health Care Guide to Influenza Preparedness”. This report provides an overview of influenza, it’s impact on public health and how hospitals can prepare for, mitigate the impact of and respond to influenza infections and outbreaks.
