What is the risk?
Currently, the risk of influenza infection is low.

Are severe cases of influenza occurring?
For the week of October 13-19, 2019, no influenza-associated ICU hospitalizations were reported (Figure 1).

Influenza A Subtyping
Since the 2009 pandemic, data on influenza virus test results have been reported by Chicago hospital laboratories performing influenza RT-PCR. During previous seasons, over 80% of all positive influenza A specimens were subtyped (e.g. H3N2, H1N1pdm09); however during the past two influenza seasons, the percentage of positive influenza A specimens being subtyped has continued to decrease (Figure 2). In 2018-2019, only a third of influenza A specimens were subtyped; of these 71% were positive for H1N1pdm09. It is important, for surveillance purposes, to monitor the subtypes of influenza A viruses circulating in the area in order to maintain situational awareness, detect any changes in local epidemiology and to identify the emergence of novel influenza A strains.

The virologic sentinel surveillance program is a way to increase the number of specimens that are being tested and subtyped at the IDPH Laboratory. The program is free and outpatient clinics can participate.

Which influenza strains are circulating?
Data on influenza virus test results are reported by Chicago laboratories performing influenza RT-PCR. For the week of October 13-19, 2019, 4 of the 711 (<1%) specimens tested for influenza were positive; 2 typed as influenza A (H3N2) and 2 typed as influenza B (Figure 3).

Since September 29, 2019, 10 of 2,155 (<1%) specimens tested for influenza have been positive; 6 typed as influenza A (6 H3N2, 0 H1N1pdm09, and 0 unknown subtype [subtyping not performed or not all subtypes tested]) and 4 typed as influenza B.
How much influenza-like illness is occurring?
Several outpatient clinics throughout Chicago participate in CDC’s Influenza-Like Illness Surveillance Network (ILINet) by reporting on a weekly basis the total number of outpatient clinic visits, and of those visits, the number with influenza-like illness (ILI). For the week of October 13-19, 2019, 115 of the 6,100 (1.9%) reported outpatient clinic visits were due to influenza-like illness, which is similar to Illinois at 1.8% (Figure 4).

In addition to ILINet, ESSENCE is an electronic syndromic surveillance system that utilizes the chief complaints of patients visiting emergency departments to monitor for influenza-like illness. Currently, ESSENCE captures nearly every emergency department visit in the city on a daily basis. For the week of October 13-19, 2019, 459 of the 24,113 (1.9%) total emergency department visits were due to influenza-like illness (Figure 5).

Figure 6 represents the percentage of emergency department visits due to influenza-like illness aggregated by patient zip code. For the week of October 13-19, 2019, 16 of 59 (27%) zip codes had ILI activity levels in the moderate to high; this is similar to last season where 29% of zip codes were also at moderate to high levels for the same time period.

Where can I get more information?
The Centers for Disease Control and Prevention’s FluView report provides national updates and trends related to the intensity of influenza activity across the United States, as well as detailed information on antiviral resistance, severity of illness, and other topics. Updates specific to Illinois and Suburban Cook County are also available online. Current and archived issues of the Chicago Flu Update can be found on the CDPH website section Current Flu Situation in Chicago.

Reporting Information
Illinois Department of Public Health recently issued Influenza Testing and Reporting Guidance. The Chicago Department of Public Health has previously issued guidance on reporting influenza-associated ICU hospitalizations. Healthcare facilities can report cases to the Chicago Department of Public Health via the Illinois National Electronic Disease Surveillance System (INEDSS). For more information contact: SyndromicSurveillance@cityofchicago.org
