What is the risk?
As of February 5, 2010, the risk of pandemic influenza A (H1N1) influenza infection in Chicago is low. The numbers of severe influenza infections, influenza-like illnesses, and positive influenza tests remain minimal. Due to the possibility of a recurrence of heightened activity in the coming months, all Chicagoans aged six months and older are encouraged to protect themselves from infection by getting vaccinated with the pandemic influenza vaccine. Chicagoans should ask their healthcare provider or pharmacist about vaccine availability. Dates and locations of City of Chicago pandemic vaccine clinics are available by calling 311.

Are severe cases of influenza occurring?
One influenza A (H1N1)-associated hospitalization in a Chicago resident has been reported for surveillance week 4 (January 24 – 30, 2010). This is a 99% decrease from the highest reported in early November (figure 1).

How much influenza-like illness is occurring?
With 15 Chicago hospitals reporting, 5.4% of emergency department visits were due to influenza-like illness (i.e. fever of 100°F or greater, with cough or sore throat). Pediatric hospitals continue to experience higher rates, but in hospitals serving adults levels of activity are comparable to what was reported in late September and early October, 2009 (figure 2). Among seven outpatient clinics reporting for the week of January 24 – 30, 2010, 2.4% of doctor’s office visits were due to influenza-like illness. This level of activity is similar to levels seen during the same surveillance week during previous influenza seasons.

Which influenza strains are circulating?
For the week of January 24 – 30, 2010, with seven laboratories reporting, all 8 influenza A-positive specimens for which subtyping was performed were reported as confirmed or presumptive pandemic influenza A (H1N1). No seasonal influenza A or influenza B strains were reported.

Where can I get more information?
This month’s edition of CDPH’s CD Info newsletter provides supplemental information about the surveillance and investigation of the 2009 pandemic in Chicago. The Centers for Disease Control and Prevention’s FluView report provides national updates and trends related to the intensity of influenza activity across the United States, as well as detailed information on antiviral resistance, severity of illness, and other topics. Updates specific to Illinois and Suburban Cook County are also available online.
