ERRATA

This page lists errors that were identified in the May 4, 2011 release of the Community Area Health & Resource Inventory (CAHRI). All errors listed have been updated in this release of the CAHRI.

p. 44, Liver disease and cirrhosis deaths reported for Montclare (Community Area 18) should read 0.

p. 156, Liver disease and cirrhosis deaths reported for Mount Greenwood (Community Area 74) should read 0.

p. 154, The Chronic Disease Deaths table for Washington Heights (Community Area 73) was replaced with the table below.

CHRONIC DISEASE DEATHS

	NUMBER	RATE	10-YR CHANGE
Heart Disease	86	217.3	-35.2
Stroke	20	*	--
Lower Respiratory Disease	13	*	--
Diabetes Mellitus	11	*	--
Liver Disease and Cirrhosis	2	*	--
Alzheimer's Disease	6	*	--

PREFACE

Chicago was divided into 75 community areas based upon social, cultural and geographic factors more than 70 years ago by a research committee at the University of Chicago. Two additional community areas have been added since 1960. Although the community areas no longer necessarily represent the boundaries of modern Chicago neighborhoods, health and healthcare resource information at the community area level is useful to many community-based organizations, planners, hospitals, universities, and other groups.

The first edition of the Community Area Health Inventory was published in 1993 by the Chicago Department of Public Health (CDPH) Office of Planning, Policy and Resource Development. The report was then expanded into two volumes by the Office of Epidemiology in 1994. In 2005, the Community Area Health Inventory significantly changed in organization and content, incorporated revised racial/ethnic categories, added more meaningful socioeconomic indicators and arranged the expanded number of health measures in a more relevant way.

The latest installment of this report has been retitled to reflect the addition of healthcare resource data, and shortened to only one volume. Information on healthcare resources are presented by community area and, for some data, by region. Chicago's community areas can be grouped into seven regions: North, Northwest, Central, West, South, Southwest, and Far South. These regional areas, adapted in part from the work of the Chicago Department of Planning (currently known as the Chicago Department of Housing and Economic Development), were developed by CDPH's Office of Policy & Planning to facilitate geographic analysis of safety net healthcare resources.

The Community Area Health and Resource Inventory report now also includes hospitalization data and updated methodologies for 10-year trend analyses of health measures. As Census 2010 data was not available when this report was being compiled, population (age, sex and race/ethnicity) and socioeconomic data is not included.

This report contains community area level data on the following topics:

- 2007 health measures, including: infant, child and maternal health; disabilities (for year 2000); mortality due to cancer, chronic disease and unnatural causes; hospitalizations; and infectious disease cases and deaths.
- 2000 medically needy population (by region as well),
- 2007 healthcare resource information including hospital capacity and utilization, and safety net provider utilization, and
- Current information on safety net provider locations throughout the City of Chicago (by region as well).

The Community Area Health & Resource Inventory summarizes data from many sources and represents the cumulative effort of the Offices of Epidemiology and Policy & Planning, the Division of STI/HIV, and the Communicable Disease, Lead Poisoning Prevention and Tuberculosis Programs. We hope that this report will prove helpful in developing effective interventions for improving the health and well-being of Chicagoans.

METHODS

OVERVIEW

This report contains two pages for Chicago and each of its 77 community areas. The first page presents data on mortality, infectious disease, hospitalizations, disabilities, and infant, child and maternal health for the geographic area. Health information is presented for 2007 with 1997 serving as a historical reference point. The second page presents data on the medically needy population in the community area and region in 2000, hospital capacity and utilization and safety net provider utilization in 2007, and locations of safety net providers in the community area as of February 2011.

DATA REPORTING CRITERIA

The guidelines for data release and cell suppression used by CDPH try to balance data accessibility with privacy concerns and confidence in the stability of the estimates that we publish. Rates and percents based on 20 or fewer events can vary widely just by random chance even when there is no meaningful statistical difference between measurements. Rare events occurring in large populations do not usually allow for the identification of individuals, but reporting small cell sizes for population subgroups increases the risk of breaching confidentiality.

The guidelines for cell suppression used in this report (adapted from the Massachusetts Department of Public Health) are based on both the numerator (event) and denominator (population or group size) values, except for Tuberculosis, Hepatitis C, Chlamydia, Gonorrhea, Syphilis and AIDS events and rates. See Table 1 for specific reporting conditions. The Division of STI/HIV, Tuberculosis and Communicable Disease Programs have a separate confidentiality standard whereby counts and rates for less than 5 events are suppressed. As such, for fewer than 5 events, counts will be reported as < 5 and rates suppressed.

An age-adjusted mortality rate will be suppressed when the total number of events is 20 or less. Percentages and rates (not age-adjusted) based on 20 events or less will be reported along with a warning to use caution when making interpretations based on these rates. Percentages and rates (not age-adjusted) based on fewer than 5 events will be suppressed. If 1997 and/or 2007 rates/percents are suppressed, 10-YR CHANGE will not be calculated, and will be indicated by "--".

POPULATION DENOMINATORS

The population denominators for calculating 1997 and 2007 rates/percentages for all health measures, except for Lead Screening, are projections based on 1990 and 2000 census data. 1997 and 2007 population projections were calculated using the following formulas:

1. Average annual rate of change (AARC) = $(\text{Population}_{2000} - \text{Population}_{1990})/10$
2. Projected Population₁₉₉₇ = $\text{Population}_{1990} + (7 * \text{AARC})$
3. Projected Population₂₀₀₇ = $\text{Population}_{2000} + (7 * \text{AARC})$

This projection method requires two assumptions: (1) the rate of population change occurs evenly over time, and (2) the rate of change for 1990-2000 is the same as 2000-2010. The population denominators for calculating 1997 Lead Screening percentages are from the 1990 census, and 2007 Lead Screening percentages are from the 2000 census.

TABLE 1. CONDITIONS FOR REPORTING DATA

REPORTED

Population > 29 AND Number of events < Population

10 ≤ Population ≤ 29 AND Number of events = 0

10 ≤ Population ≤ 29 AND Population - Number of events > 5

Population < 10 AND Number of events = 0

NOT REPORTED

10 ≤ Population ≤ 29 AND Population - Number of events ≤ 5

Population < 10 AND 1 ≤ Number of events ≤ 9

At the time that this report was prepared, data from the 2010 U.S. census had not been released. When the 2010 census redistricting summary file was released in February 2011, it indicated a 6.9% decrease in the Chicago population (a decrease of 200,418 individuals). Based on these data, sixty of the 77 community areas have experienced population loss. This suggests that the method used to project the 2007 population for this report likely resulted in overestimates of the population of many community areas as well as Chicago as a whole. The rates, age-adjusted rates, and percents we present for 2007 differ from what would be calculated using the 2010 census counts.

CAUSE OF DEATH DETERMINATION

All deaths are registered using death certificates. Death certificates are processed and analyzed by a standardized system that is used in most countries throughout the world, the International Classification of Diseases (ICD). On the death certificate, the certifier (a physician, coroner or medical examiner) enters information about the causes and circumstances of death in a specific sequence. When received by the vital statistics office, the listed causes are placed in standard categories, and the underlying cause of death is then determined.

Underlying cause of death is not necessarily the first medical condition listed on the death certificate. All of the information on the certificate is examined systematically, using classification rules, to determine the most appropriate underlying cause of death.

The system is periodically revised to reflect advances in medical knowledge and public health priorities. The ninth revision, ICD-9,

was used for deaths in the United States for twenty years, 1979-1998. The ICD-10 is the most recent update, and is being used for US deaths starting from 1999. There are important differences between ICD-10 and its predecessor, ICD-9, including the following:

- The number of detailed categories has nearly doubled.
- Important changes in some of the rules for classifying underlying cause of death.

Therefore, even with the same information being recorded on the death certificate, a death can be attributed to a different underlying cause of death. Due to these differences, mortality rates based on data classified under ICD-10 cannot be directly compared to ICD-9. In order to compare mortality statistics based on deaths classified by ICD-9 to ICD-10, a comparability ratio can be applied to counts and rates. Ratios were determined by a comparability study conducted by the National Center for Health Statistics. The causes of death and corresponding comparability ratios used in this publications are listed in Table 2.

HOSPITALIZATIONS

The data presented in the Community Area Health & Resource Inventory reflect estimated hospital discharges reported from Illinois hospitals and licensed ambulatory surgery centers to the Illinois Health Care Cost Containment Council (until 2001) and the Illinois Department of Public Health (IDPH). Hospitalization discharge data can be used as a proxy for disease incidence, but with noted limitations. Hospital discharges, not individual patients, are recorded. Moreover, discharges may poorly measure some conditions because only those severe cases in which hospitaliza-

tion is required are included in the database.

Additionally, hospital discharges are stratified by resident zip codes, not community areas. Therefore, hospital discharges by community area were estimated using a methodology developed by MCIC (Metro Chicago Information Center). The rate of hospital discharges in a given patient zip code were assumed to be uniform within a given zip code. MCIC provided data on what percentage of a zip code population belonged to a given community area and what zip codes were in each community area. These percentages were applied at random to all of the records pertaining to a given zip code in order to redefine the geography of patient residences as community areas. Finally, the records assigned to each community area were pooled and analyzed to obtain the community area-based estimate.

TABLE 2. CAUSE OF DEATH COMPARABILITY RATIOS

CAUSE OF DEATH	COMPARABILITY RATIO
HIV/AIDS	1.0821
Influenza and Pneumonia	0.7144
All-cancers	1.0093
Breast Cancer	1.0073
Colon Cancer	0.9988
Lung Cancer	0.9901
Prostate Cancer	1.0144
Accidents	1.0251
Homicide	1.002
Suicide	0.9834
Heart Disease	0.9976
Stroke	1.0502
Lower Respiratory Disease	1.0332
Diabetes Mellitus	1.0193
Liver Disease and Cirrhosis	1.0321
Alzheimer's Disease	1.4472

INFECTIOUS DISEASES

The numbers and rates for infectious diseases that are required to be reported are always subject to variations in reporting and detection, since health care providers are not always compliant with reporting requirements and persons affected by these illnesses do not always seek medical care.

TEN YEAR TREND ANALYSIS

Percent change in rates or percents 1997 to 2007 are calculated (10-YR CHANGE) using the following formula:

$$\begin{aligned} &[(\text{rate}_{2007} - \text{rate}_{1997})/\text{rate}_{1997}] * 100 \\ &[(\text{percent}_{2007} - \text{percent}_{1997})/\text{percent}_{1997}] * 100 \end{aligned}$$

A “+” sign indicates an increase over time, “-” a decrease.

In the Community Area Health & Resource Inventory, rates for causes of death, all cause mortality and hospital discharges are age-adjusted, which is explained in the next section. Confidence interval testing is used to determine if changes in age-adjusted rates between 1997 and 2007 are significant at the 0.1 level, which is indicated in the tables. 90% confidence intervals (CI) are calculated for each measure using the following formulas:

$$\begin{aligned} \text{SE} &= R/(\sqrt{N}) \\ 90\% \text{ CI} &= R \pm (1.645 * \text{SE}) \end{aligned}$$

where SE = standard error, R = age-adjusted rate and N = number of events (deaths or discharges). A statistically significant change is considered to have occurred if the point estimate of the 1997 age-adjusted rate is not within the 90% confidence interval for the corresponding 2007 age-adjusted rate.

For all other measures, Chi-square testing is used to determine if changes in rates/percentages between 1997 and 2007 are significant at the 0.1 level, which is indicated in the tables. Poisson regression in a log-linear model is utilized with independent variables: year, community area and population, and the dependent variable: number of events (e.g., birth, infectious disease case).

AGE-ADJUSTED RATE CALCULATIONS

Age adjustment is a technique that is used to make it easier to interpret differences in disease rates between different populations. Most important health conditions vary with age. The populations in different community areas vary in their age composition. Similarly, the population in the same geographic area varies in its age composition over time. When comparing rates of death and hospital discharges, we would like to be able to separate differences that are due to potentially modifiable risk factors from differences that are due to age. With direct age adjustment, a reference or standard population is identified, and weights are assigned to age-specific groups based on their representation in the standard population. All of the weights add up to 1. The age-adjusted rate for a population is a weighted average of the age group specific rates for the population, using the weights derived from the standard population.

TABLE 3. AGE-ADJUSTMENT WEIGHTS FOR YEAR 2000 STANDARD POPULATION

AGE (YEARS)	WEIGHT
0-14	0.2147
15-34	0.274219
35-54	0.297447
55+	0.213634

Age-adjusted rates that are derived using the same standard population can be compared to each other, but they CANNOT be compared to age-adjusted rates using different standard populations. Age-adjusted rates are summary statistics for comparisons, and NOT actual rates - they cannot be applied to a specific population to get the actual number of events that occurred in that population.

The projected U.S. population for the year 2000 is currently used as the reference (standard) population for age adjustment by CDPH. This makes our data consistent with reports issued by all agencies within the U.S. Department of Health and Human Services, which uniformly adopted the projected U.S. population for year 2000 as their standard for age adjustment for health events or deaths occurring in 1999 or later. The age-adjustment weights used in this publication are listed in Table 3.

GENERAL LIMITATIONS

This report is intended as a resource for advocates, providers, planners, and others. It is descriptive and is not intended to serve as a causal analysis. For example, if a community has a high cancer mortality rate, this may not be caused by characteristics of the community. Answering these questions would require further investigation. For some measures, such as breast cancer mortality, which are based on relatively few events at the community area level, other limitations must be considered. These rates are subject to substantial random variability.

DEFINITIONS OF MEASURES

HEALTH MEASURES

Caesarean Section

The annual number and percent of births to resident mothers who were delivered by Caesarean section.

Source: IDPH Division of Vital Records

Causes of Death

The annual number of resident deaths and the age adjusted annual death rate per 100,000 population are given for each of the indicated causes of death. The specific causes of death listed here are not exhaustive. Breast cancer rates are for females and males. For each community area, the causes are grouped into 4 categories: infectious disease, cancer, unnatural and chronic disease. The causes of death and corresponding ICD-9 and ICD-10 codes are listed in Table 4.

Source: IDPH Division of Vital Records

Disabilities

Blind/Deaf: Non-institutionalized, civilian persons aged 5 and older with a long-lasting condition such as: blindness, deafness, or a severe vision or hearing impairment.

Physical: A condition that substantially limits one or more basic physical activities like walking, climbing stairs, reaching, lifting or carrying.

Mental: A condition that makes it difficult to learn, remember, or concentrate.

Requires Care: A condition that makes it difficult to dress, bathe, get around inside the home.

Home-Bound: A condition that makes it difficult to go outside the home alone to shop or visit a doctor's office.

Unable to Work: A condition that makes it difficult to work at a job or business, refers only to persons between the ages of 16 and 64.

These categories are NOT mutually exclusive.

Source: United States Census (Year 2000)

Fertility

The annual number of births and fertility rate, defined as the number of births per 1000 women of child-bearing age (15-44) in the geographic area.

Source: IDPH Division of Vital Records

First Trimester Prenatal Care

The annual number and percent of births to pregnant women residing in Chicago receiving prenatal care in the first trimester.

Source: IDPH Division of Vital Records

Hospitalizations

The estimated, annual number of resident hospitalization discharges and rate per 100,000 population are given for each of the indicated primary diagnoses. The specific primary diagnoses listed here are not exhaustive. Hospitalization discharge rates are for all ages. The primary diagnosis and corresponding ICD-9-CM codes are listed in Table 5.

Source: IDPH

TABLE 4. CAUSE OF DEATH ICD-9 AND ICD-10 CODES

CAUSE	ICD-9 CODES	ICD-10 CODES
HIV/AIDS	042-044	B20-B24
Influenza and Pneumonia	480-487	J10-J18
All-cancers	140-208	C00-C97
Breast Cancer	174-175	C50
Colon Cancer*	153-154	C18-C21
Lung Cancer†	162	C33-C34
Prostate Cancer	185	C61
Accidents	E800-E869, E880-E929	V01-X59, Y85-Y86
Homicide	E960-E969	X85-Y09,Y87.1
Suicide	E950-E959	X60-X84,Y87.0
Heart Disease	390-398, 402, 404, 410-429	I00-I09, I11, I13, I20-I51
Stroke	430-434, 436-438	I60-I69
Lower Respiratory Disease	490-494, 496	J40-J47
Diabetes Mellitus	250	E10-E14
Liver Disease and Cirrhosis	571	K70, K73-K74
Alzheimer's Disease	331.0	G30

*Includes cancers of the rectum and anus

†Includes cancers of the trachea and bronchus

TABLE 5. PRIMARY DIAGNOSIS ICD-9-CM CODES

CAUSE	ICD-9-CM CODES
Alcohol and Substance Abuse	291-292, 303-305
All Other Mental Health	290, 293-302, 306-319
Asthma	493
Congestive Heart Failure	428, 402.01, 402.11, 402.91
Diabetes	250

Infant Mortality

The annual number and rate of deaths of resident infants (younger than one year of age). The rate is the number of infant deaths per 1,000 live births to mothers residing in the geographic area.

Source: IDPH Division of Vital Records

Infectious Diseases (Reportable)

Reportable diseases are those that are mandated by state law to be tabulated and reported to the appropriate health authority, in this case CDPH. The infectious, reportable conditions selected for this report are:

- AIDS
- Chlamydia
- Gonorrhea
- Hepatitis C
- Syphilis (primary and secondary)
- Tuberculosis

The annual number of cases and incidence rates per 100,000 population are given for all conditions except for Hepatitis C, which reflect the number of individuals with Hepatitis C positive test results registered for the first time by CDPH in 2007. Hepatitis C and Syphilis data are not available for 1997. None of the rates are age-adjusted.

Sources: CDPH Division of STI/HIV, Tuberculosis & Communicable Disease Programs

Lead Screening

Screened is the number and percent of resident children age 6 and younger with at least one lead screening.

Elevated is the number and percent of resident children screened with a blood lead level higher than 9 micrograms per deciliter. If a child was screened more than once, only one elevated screening is reported here.

Source: CDPH Lead Poisoning Prevention Program

Premature Birth

The annual number and percent of resident births with less than 37 completed weeks in the womb.

Source: IDPH Division of Vital Records

Very Low Birthweight

The annual number and percent of resident births weighing less than 1500 grams (3.25 pounds).

Source: IDPH Division of Vital Records

HEALTHCARE RESOURCE MEASURES

Average Occupancy Rate

Measure of inpatient health facility's occupied beds, determined by dividing average daily census by the calculated capacity. Average daily census is the average number of inpatients receiving service on any given day over a 12-month period. The calculated capacity is the number of beds set up and staffed (See Beds Staffed).

Source: IDPH Annual Hospital Questionnaire

Beds Licensed

Number of beds recognized and licensed by IDPH.

Source: IDPH Annual Hospital Questionnaire

Beds Staffed

Number of beds/stations set up and staffed on a particular day (October 1).

Source: IDPH Annual Hospital Questionnaire

Emergency Department Visits

The number of visits to a hospital's emergency and/or trauma unit.

Source: IDPH Annual Hospital Questionnaire

Encounters Provided

The number of patient encounters with a physician or mid-level provider (nurse practitioner, physician's assistant or certified nurse midwife).

Sources: CDPH Office of Policy & Planning, Illinois Department of Human Services

Facility Types

Hospitals provide acute care and general services. (Other types of hospitals, e.g., rehabilitation, mental health, etc., are excluded.)

CDPH Health Centers provide comprehensive primary care services in an ambulatory setting (i.e., not hospital-based) and are operated by CDPH.

Cook County Health Centers (located in Chicago) provide comprehensive primary care services in an ambulatory setting and are operated by the Cook County Health & Hospitals System.

Community-based Health Centers (general population) provide comprehensive primary care services to vulnerable populations with limited health coverage (e.g., uninsured, Medicaid recipients, etc.). Some may provide oral health services.

Community-based Health Centers (special populations) provide comprehensive primary care services to vulnerable populations with limited health coverage and focus their care on special populations (e.g., specific race/ethnic groups, sexual orientation, health condition, age, gender, etc.). Some may provide oral health services.

School-based Health Centers operate in schools and provide comprehensive primary care services to students. Services may also be offered to school faculty, staff, family members of students and community members. Some may provide oral health services.

Free Health Centers provide primary care services at no cost. A few sites offer comprehensive services, while most provide only basic care. Many have limited hours. Services may be focused on specific populations, including: homeless, children, specific ethnic or religious groups, etc.

Oral Health Care Centers provide oral health care services to vulnerable populations with limited health coverage.

Sources: CDPH Office of Policy & Planning, Chicago Community Oral Health Forum, IDPH Annual Hospital Questionnaire

Inpatient Admissions

Number of patients accepted for inpatient service during a 12 month period.

Source: IDPH Annual Hospital Questionnaire

Medically Needy

The number of persons who are less than 65 years of age and under 200% of poverty.

Source: United States Census (Year 2000)

Number of Sites

The number of safety net health centers operating in 2007.

Sources: CDPH Office of Policy & Planning, Illinois Department of Human Services

Number Reporting

The number of safety net health centers that provided data to CDPH for the 2007 CDPH Community Health Center Report or the Illinois Department of Human Services 2007 School Health Center Report.

Sources: CDPH Office of Policy & Planning, Illinois Department of Human Services

Outpatient Visits

The number of outpatient visits provided by a hospital, including visits provided on the hospital campus and off-site facilities.

Source: IDPH Annual Hospital Questionnaire

Patients Seen

The number of unduplicated patients seen at each safety net health center.

Sources: CDPH Office of Policy & Planning, Illinois Department of Human Services

Safety Net Health Centers

Health centers that deliver health care to underserved populations (uninsured, Medicaid and other vulnerable populations) for free, at a low-cost or a sliding fee scale.

Source: CDPH Office of Policy & Planning
