The pound sign (#) in the amount added field denotes that the reagent was used undiluted. All calculations are performed using the stated concentration for this reagent.

# GC/MS SEMI VOA BATCH WORKSHEET

Lab Name: TestAmerica Denver  Job No.: 160-32649-1

SDG No.:

Batch Number: 444835  Batch Start Date: 01/21/19 06:56  Batch Analyst: Matsumoto, Jordan T

Batch Method: 3510C  Batch End Date: 01/21/19 19:45

| Batch Notes | |
|---|---|
| Acid Used for pH Adjustment ID | 1:1 H2SO4_00075 |
| Balance ID | 24750399 |
| Base Used to Adjust pH ID | 10N_NaOH_00133 |
| Batch Comment | DV-OP-0006/0007 |
| Analyst ID - Concentration | CR |
| Concentration 1 Corrected Temperature | 84 Degrees C |
| Equipment ID - Concentration 1 | A |
| Analyst ID - Extraction | JM |
| Method/Fraction | 3510C/8270D |
| Na2SO4 ID | 0000213903_00002 |
| NaCl ID | 184223 |
| Pipette/Syringe/Dispenser ID | 1n2s |
| Prep Solvent ID | MeCl2_Cycl_00422 |
| Prep Solvent Volume Used | 180 mL |
| Analyst ID - Spike Analyst | JM |
| Analyst ID - Spike Witness Analyst | Reviewer: AAG |
| Sufficient Volume for Batch QC | NO |
| Concentration 1 Uncorrected Temperature | 85 Degrees C |
| Reagent Water ID | S. ELGA |

| Basis | Basis Description |
|---|---|
| T | Total/NA |

The pound sign (#) in the amount added field denotes that the reagent was used undiluted. All calculations are performed using the stated concentration for this reagent.

The pound sign (#) in the amount added field denotes that the reagent was used undiluted. All calculations are performed using the stated concentration for this reagent.

# PESTICIDES BATCH WORKSHEET

Lab Name: TestAmerica Denver  Job No.: 160-32649-1

SDG No.:

Batch Number: 444680  Batch Start Date: 01/18/19 12:03  Batch Analyst: Stewart, Klaudia J

Batch Method: 3510C  Batch End Date: 01/21/19 19:20

| Batch Notes | |
|---|---|
| Balance ID | 24750399 |
| Batch Comment | DV-OP-0006/0007; r2d2 @ 2x5.00 mL |
| Analyst ID - Concentration | CR |
| Concentration 1 Corrected Temperature | 88 Degrees C |
| Equipment ID - Concentration 1 | C |
| Exchange Solvent ID | Hexane_Cycl_00054 |
| Analyst ID - Extraction | KS |
| Method/Fraction | 3510C/8081A/8082 |
| Na2SO4 ID | 0000213903_00002 |
| NaCl ID | 184223 |
| Pipette/Syringe/Dispenser ID | 1n2s |
| Prep Solvent ID | MeCl2_Cycl_00422 |
| Prep Solvent Volume Used | 180 mL |
| Analyst ID - Spike Analyst | KS (trainer) + EB (trainee) |
| Analyst ID - Spike Witness Analyst | Reviewer: MM |
| Sufficient Volume for Batch QC | No |
| Concentration 1 Uncorrected Temperature | 87 Degrees C |
| Reagent Water ID | S. ELGA |

| Basis | Basis Description |
|---|---|
| T | Total/NA |

The pound sign (#) in the amount added field denotes that the reagent was used undiluted. All calculations are performed using the stated concentration for this reagent.

FORM VI
DIOXIN BY ISOTOPIC DILUTION - INITIAL CALIBRATION DATA
RESPONSE AND CONCENTRATION

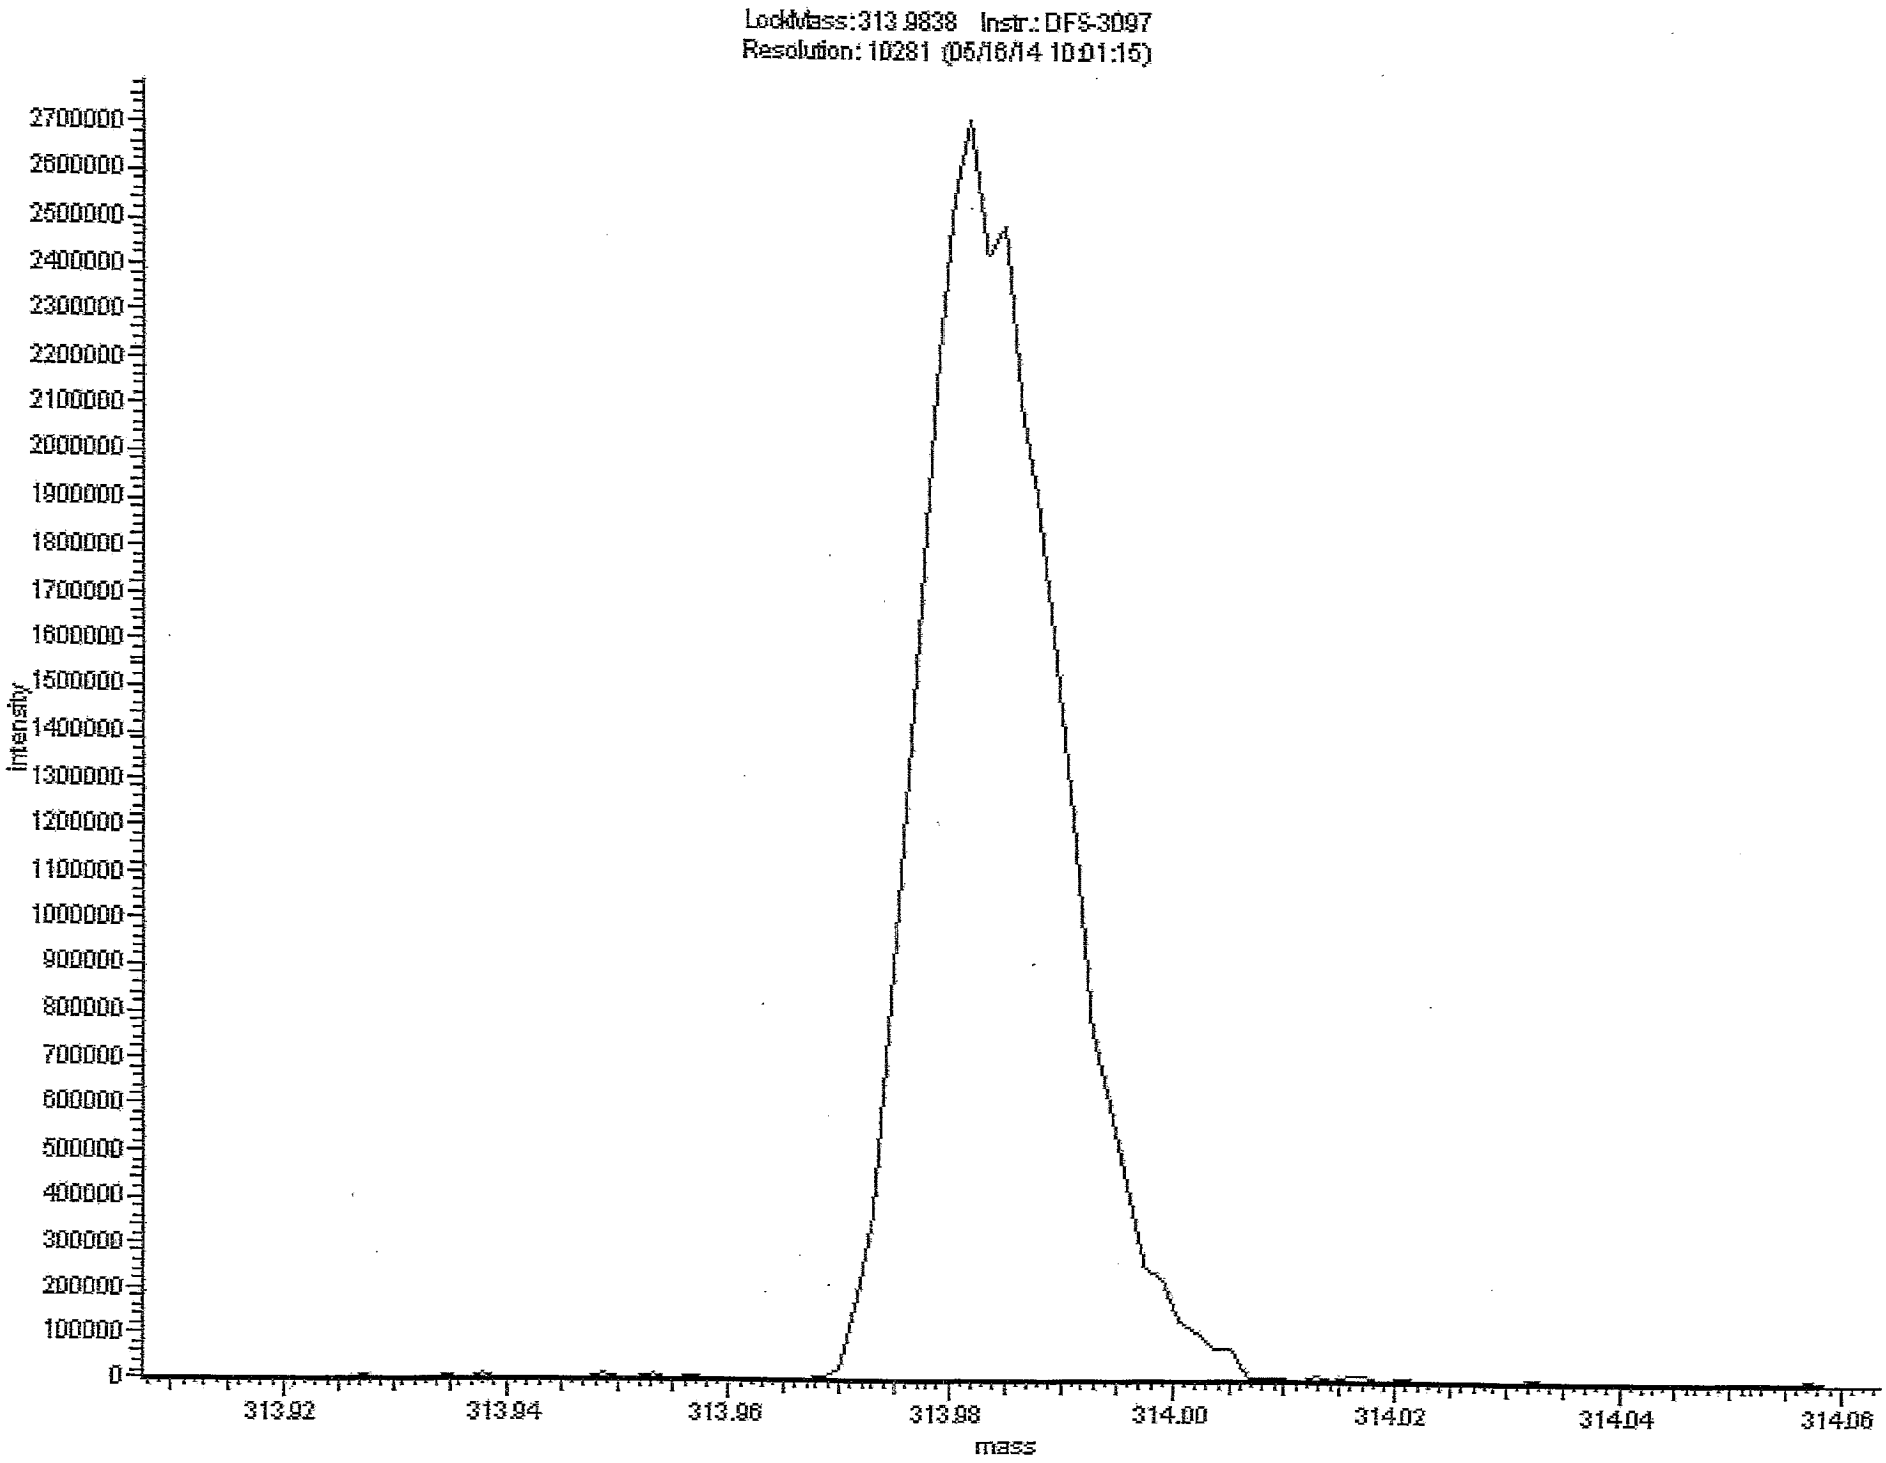
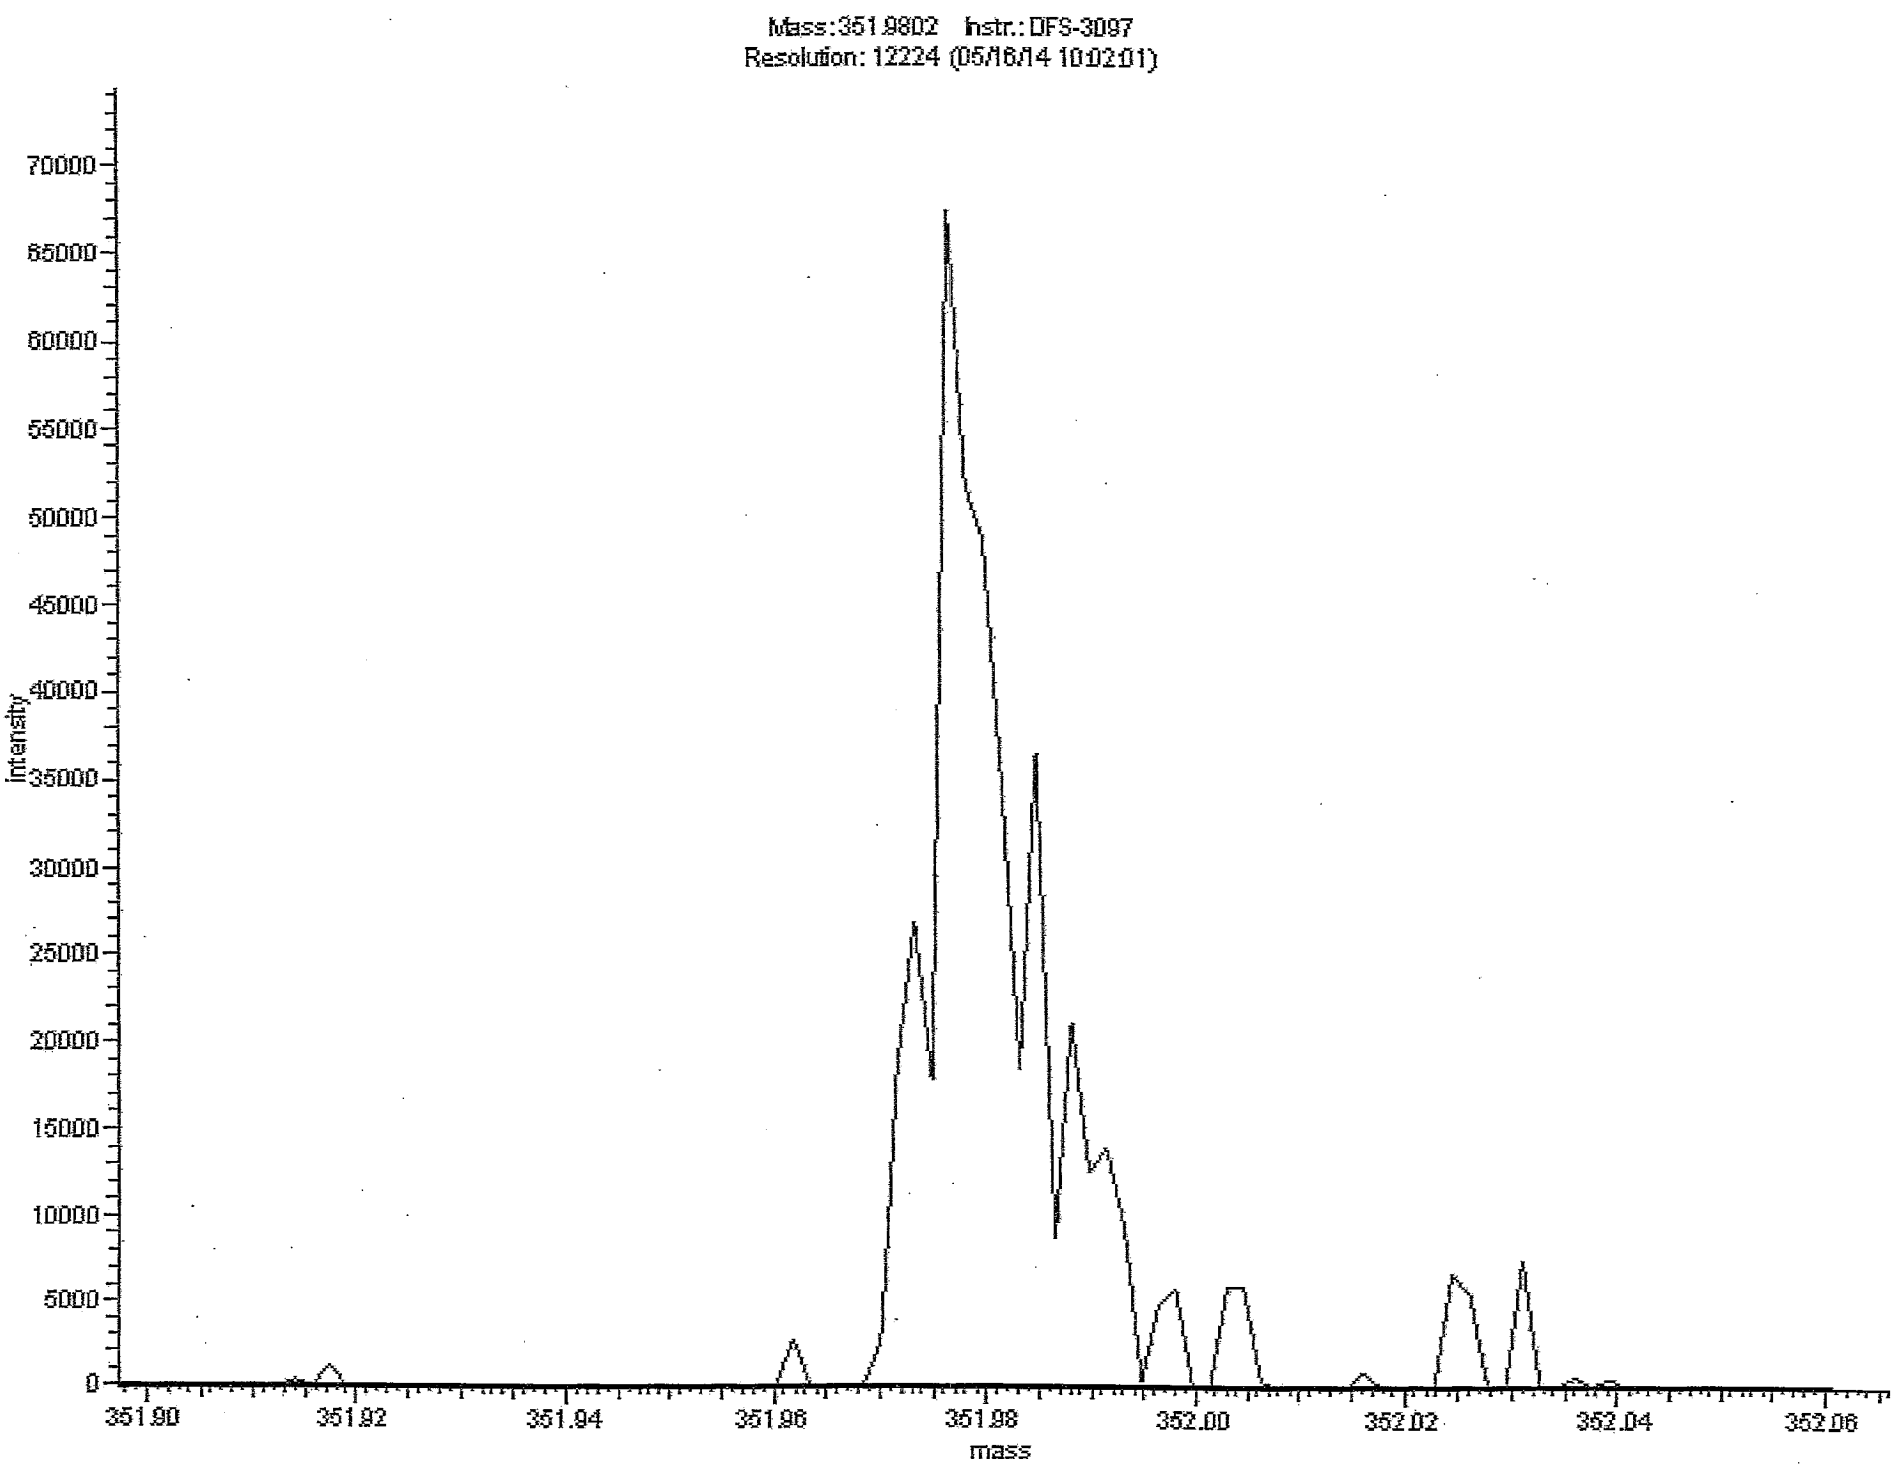
Lab Name: TestAmerica Knoxville | Job No.: 160-32649-1 | Analy Batch No.: 7768

SDG No.:

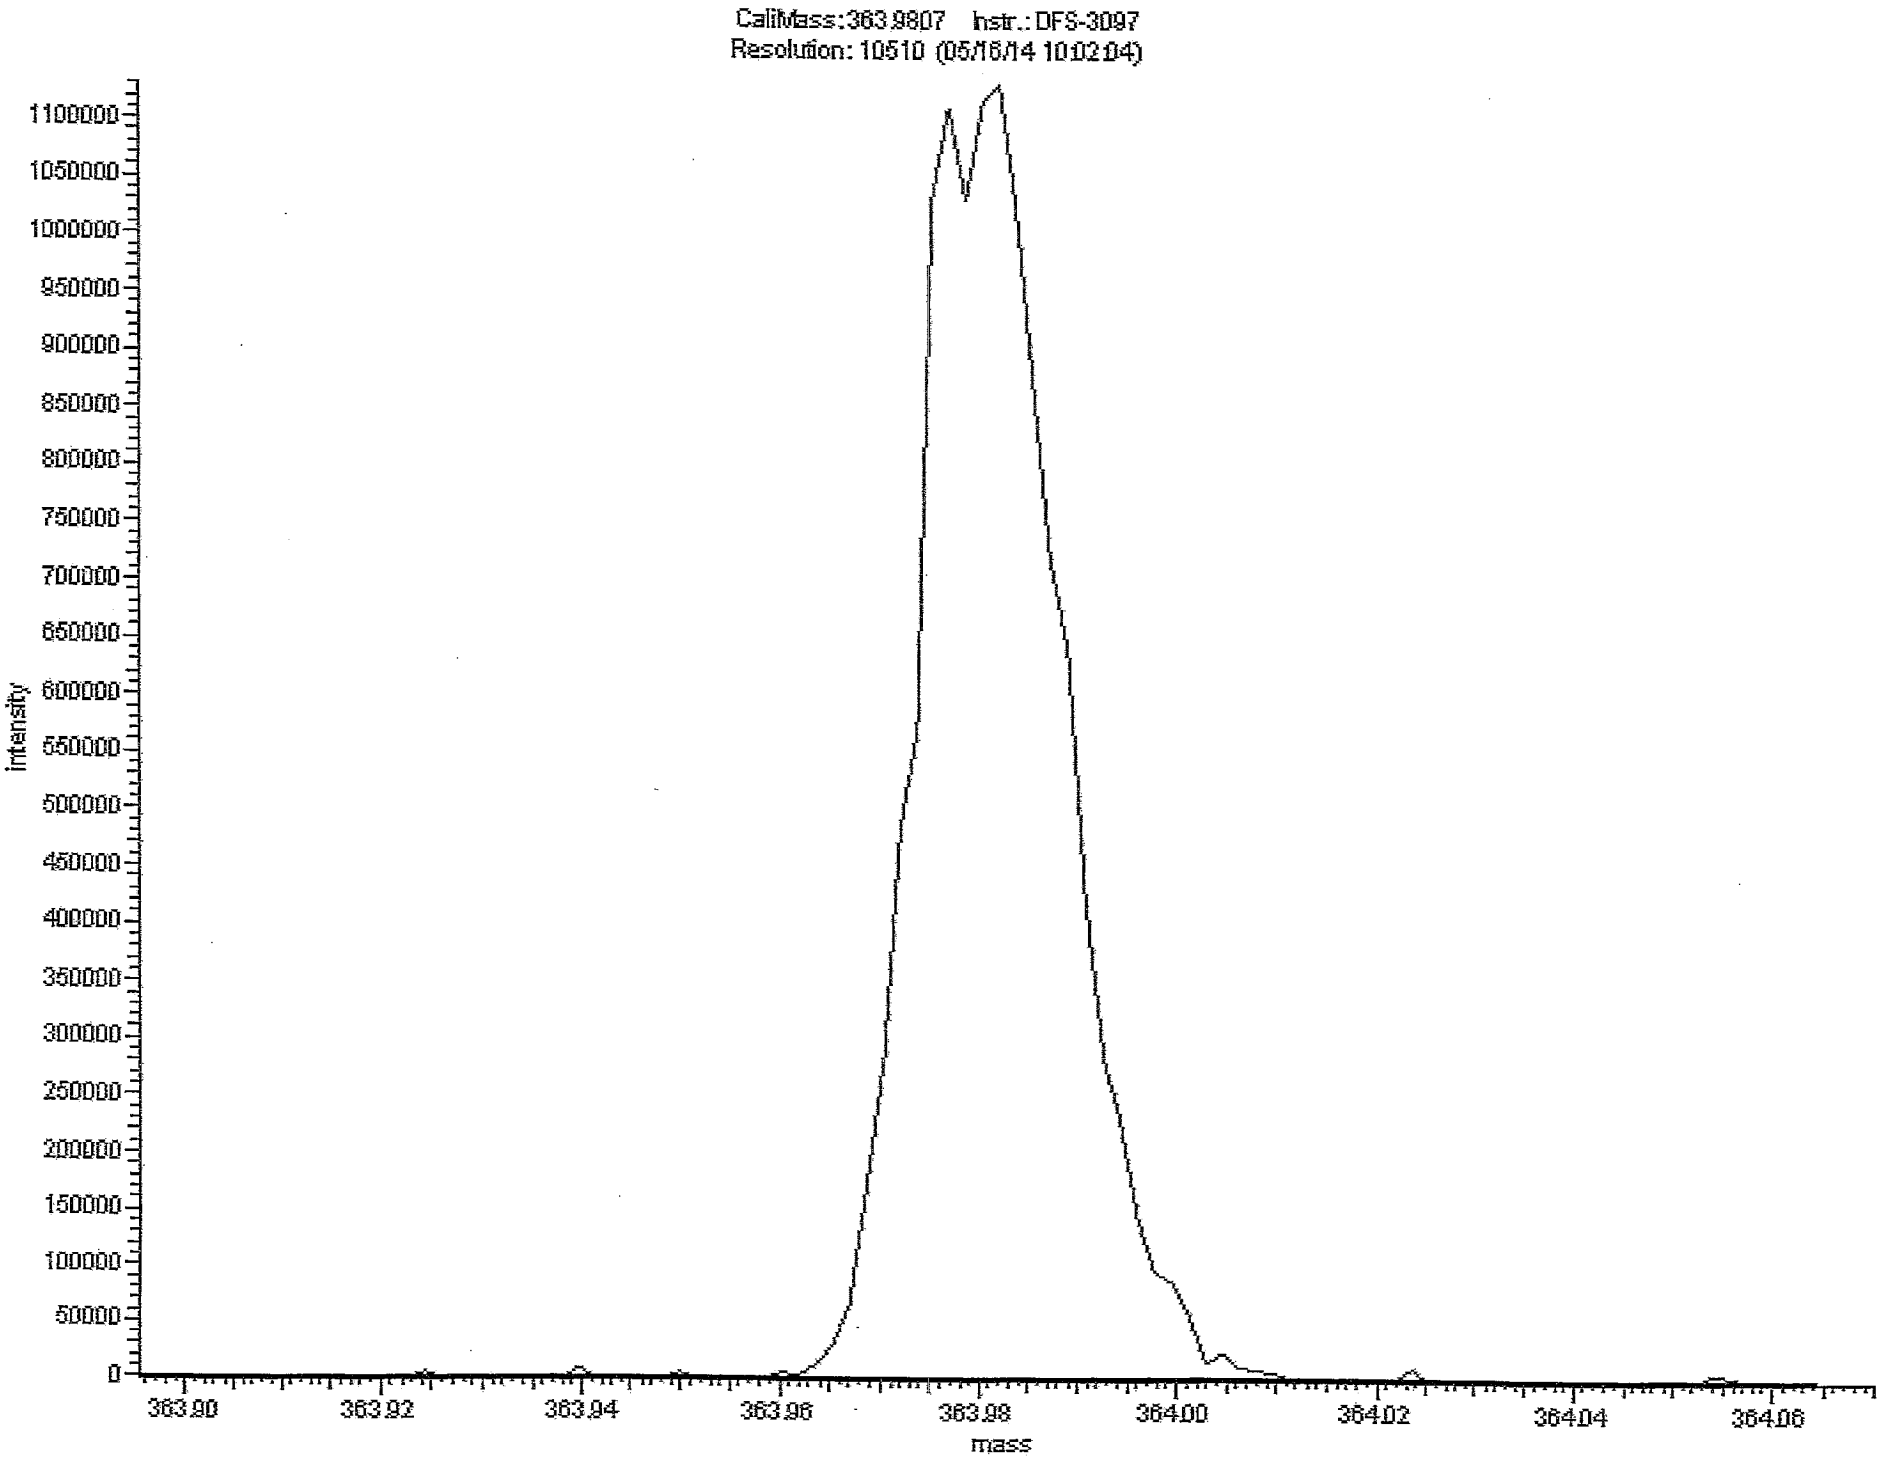
Instrument ID: D2A | GC Column: RTX-5 | ID: 0.32(mm) | Heated Purge: (Y/N) N



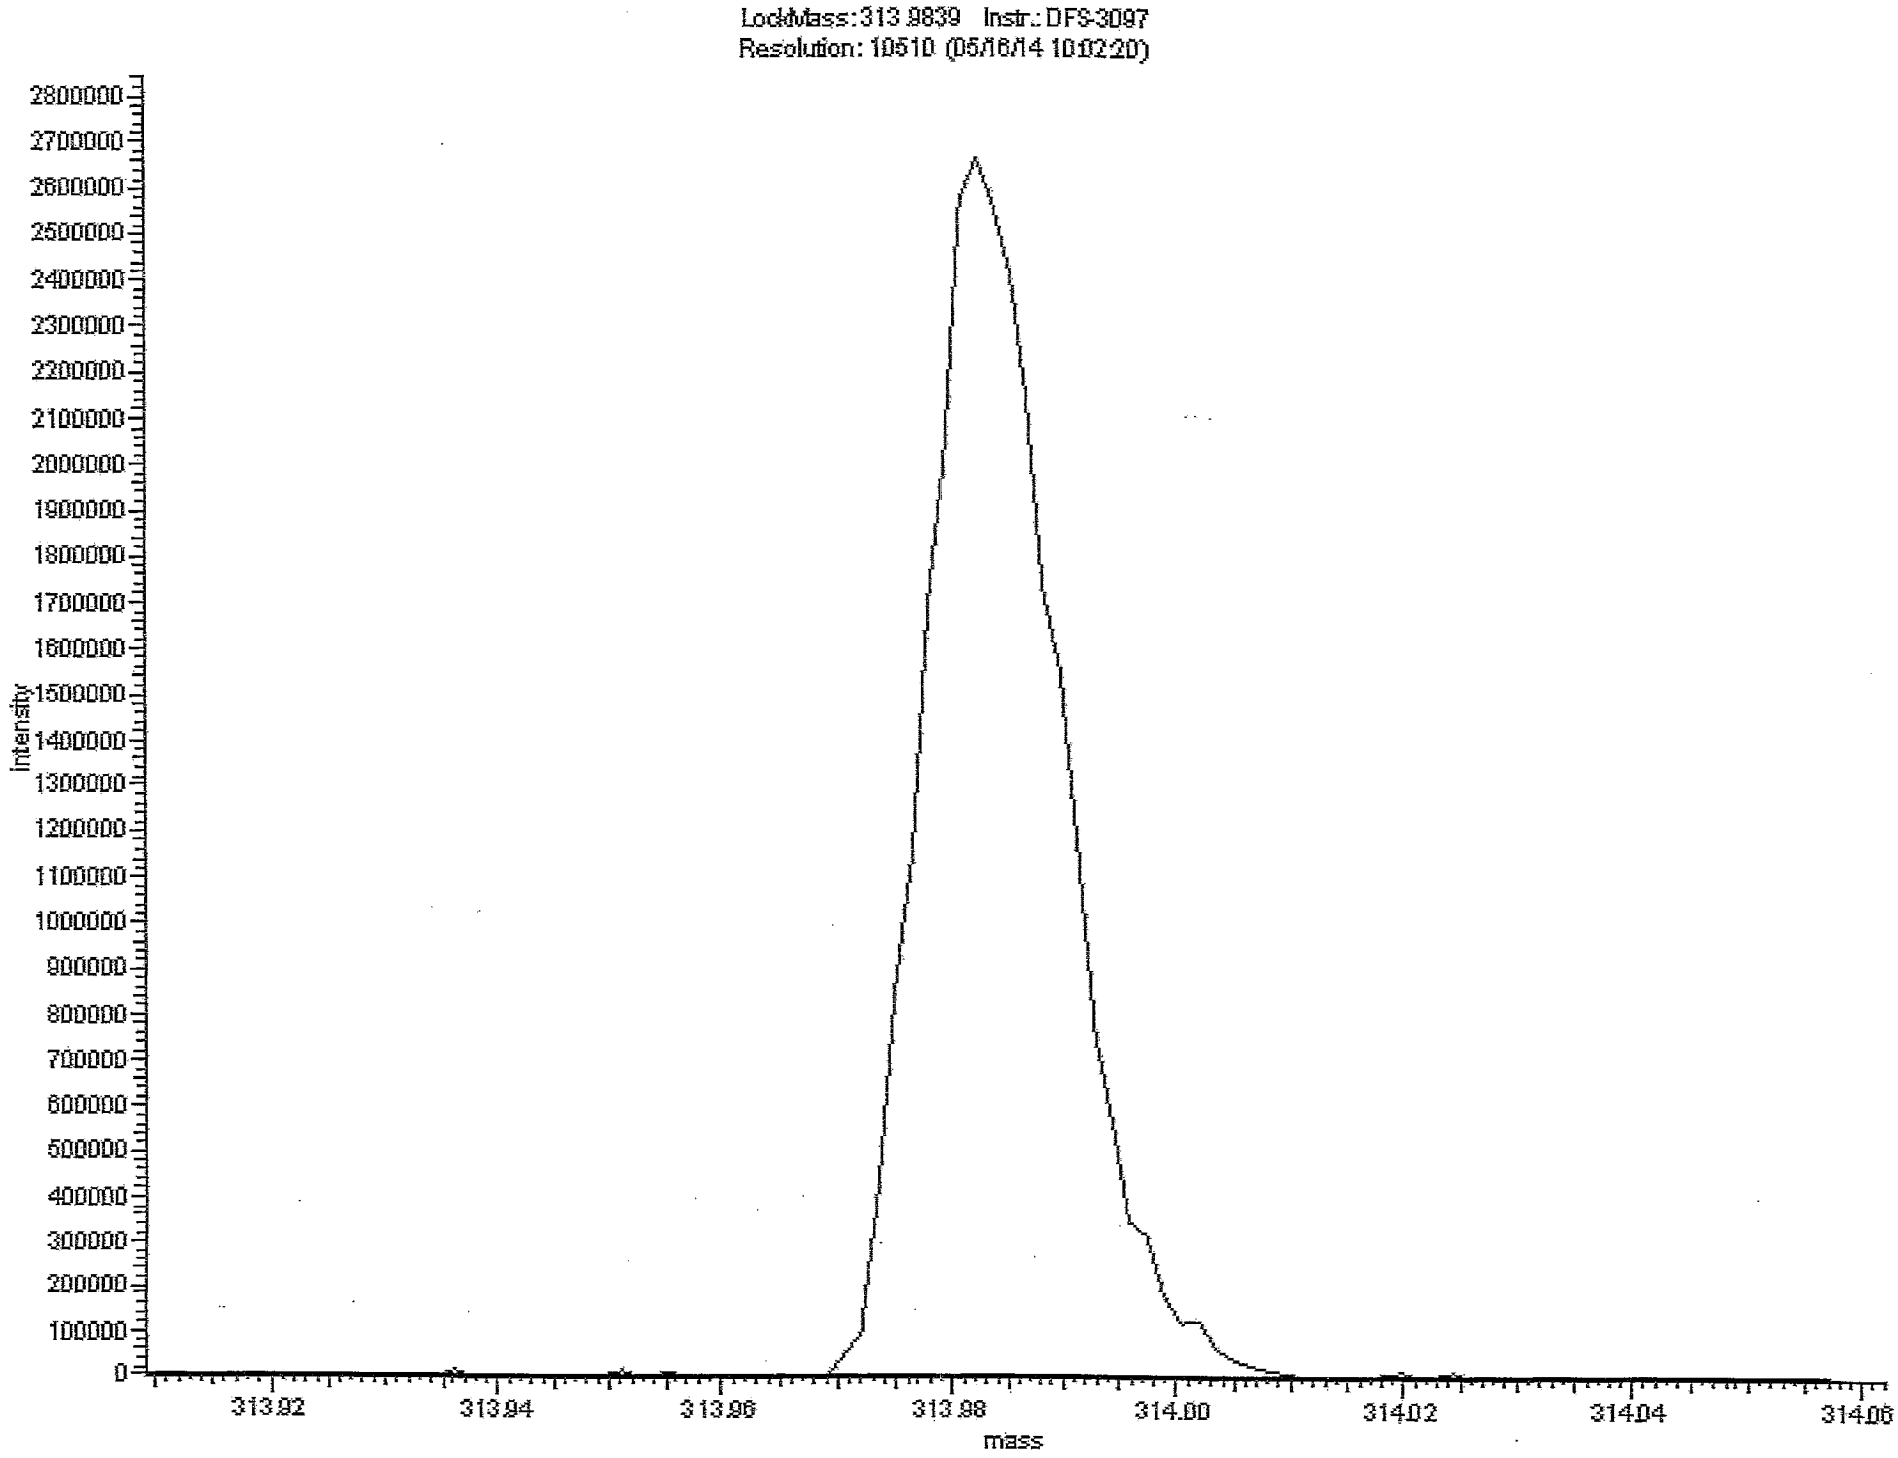
Calibration Start Date: 05/16/2014 14:26 | Calibration End Date: 05/16/2014 18:31 | Calibration ID: 825



Curve Type Legend:



| |
|---|
| Ave = Average ISTD |
| AveID = Average isotope dilution |



```

# TestAmerica Knoxville Dioxin GC/MS Initial Calibration Data Review / Narrative Checklist
## Method: 1613B - KNOX-ID-0004-R12

| Mass Res. / Date/Time: | 5-16-14/10:01 | Instr: | D2A | Win Filename: | d31405160l | Col Perf Filename: | d31405160l |
|---|---|---|---|---|---|---|---|

| CS0.5 Filename | CS1 Filename | CS2 Filename | CS3 Filename | CS4 Filename | CS5 Filename |
|---|---|---|---|---|---|
| d31405161b | d31405161l | d31405160z | d31405160 3 | d31405161 4 | d31405161 5 |

| Review Items | N/A | Yes | No | If No, why is data reportable? | 2nd Level |
|---|---|---|---|---|---|
| 1. Was the mass resolution documented before beginning the initial calibration? | | ✓ | | | ✓ |
| 2. Was the instrument resolution >10,000 (<100 ppm) on PFK m/z 304.9824 and m/z 380.9760 (MAT) and > 10,000 on FC43 m/z 313.9838, 351.9802 and 363.9807? FC43 m/z 313.9838, 351.9802 and 375.9802? FC43 m/z 375.9802, 401.9770 and 413.9770? FC43 m/z 413.9775, 425.9770 and 463.9738? FC43 m/z 425.9775, 463.9743 and 501.9706? (DFS) | | ✓ | | | ✓ |
| 3. Was the measured exact mass of m/z 380.9760 (PFK) or m/z363.9807 (FC43) within 5 ppm at reduced accelerating voltage? | | ✓ | | | ✓ |
| 4. Was the Window Defining Mixture analyzed and the MID switchpoints set to encompass the retention time windows of each congener group? | | ✓ | | | ✓ |
| 5. Was the Column Performance solution analyzed and the %Valley ≤25 for separation between 2378-TCDD/F and the closest eluting non-2378 isomer on their respective columns? | | ✓ | | | ✓ |
| 6. Were the five calibration standard solutions, at the concentrations specified in Table 5 of the SOP, analyzed (6 point calibration used for microwave extractions)? | | ✓ | | | ✓ |
| 7. Was date/time of analysis verified between analysis header and logbook as correct? | | ✓ | | | ✓ |
| 8. Were the response factors calculated for each labeled standard and unlabeled native analyte using the SOP specified reference compound (Table 3), quantitation ions (Table 21) and formula (Section 10.2.7)? | | ✓ | | | ✓ |
| 9. Is the retention time of $^{13}C_{12}$-1,2,3,4-TCDD >25.0 minutes on the DB/Rtx-5 column (15.0 minutes on the DB/Rtx-225 column)? | | ✓ | | | ✓ |
| 10. Are the relative retention times of all PCDDs/PCDFs and all labeled compounds within the limits specified in Table 3? | | ✓ | | | ✓ |
| 11. Are %RSD ≤20% for all unlabeled native analytes except 1,2,3,7,8,9-HxCDD and OCDF? | | ✓ | | | ✓ |
| 12. Are %RSD ≤35% for 1,2,3,7,8,9-HxCDD and OCDF and all labeled internal standards? | | ✓ | | | ✓ |
| 13. Are all S/N ratios ≥10 for the GC signals in each EICP (extracted ion chromatographic profile) including internal standards? | | ✓ | | | ✓ |
| 14. Are the ion abundance ratios for all labeled and unlabeled analytes within the control limits specified in Table 22 of the SOP? | | ✓ | | | ✓ |
| 15. Was the second source ICV standard analyzed according to Sec 10.2.9 of the SOP? | | ✓ | | | ✓ |
| 16. If manual integrations were performed, are they clearly identified, initialed and dated? | ✓ | | | | ✓ |
| 17. Were before/after chromatograms reviewed to determine whether the software and manual integrations were appropriate? | | ✓ | | | ✓ |
| 18. Were manual integrations documented properly? | ✓ | | | | ✓ |
| 19. If criteria were not met, was a NCM generated, approved by supervisor, and copy included in folder? | ✓ | | | | ✓ |
| 20. Does the ICAL folder contain **complete** data in the following order: Data review checklist, a **complete** run log, Avg. %RSD summary, Ratio summary, Calculation summary, PFK/FC43 resolution/peak match documentation; Total RIC, EICP's and manual integration - for window and all standards, in order from low to high standard, ICV Summary Table, Calculation Summary, and chromatograms? | | ✓ | | | ✓ |

# Executive Summary

CH2M HILL, Inc. (CH2M HILL) performed this Phase II environmental site assessment (ESA) on behalf of Chicago 2016 for the Michael Reese Hospital Facility in Chicago, Illinois. The purpose of this Phase II ESA was to identify and characterize soil and groundwater conditions that may need to be addressed (through additional characterization, management, or remediation) pursuant to proposed site redevelopment. This goal was achieved by assessing the condition of soil and groundwater media at the site and comparing the Phase II analytical results with established Illinois Tiered Approach to Corrective Action Objectives (TACO) Tier 1 cleanup criteria. This report documents the site investigation procedures, associated results, and key findings pertaining to the facility (hereafter referred to as the "property" or "site"), located at 2929 South Ellis Avenue, Chicago, Illinois. It is prepared exclusively for use by Chicago 2016 (and the City of Chicago) and may not be relied upon by others without written authorization.

Work was conducted pursuant to CH2M HILL's proposal dated May 2, 2008, and the directive from Chicago 2016 to streamline the Phase IIb effort to more broadly assess nature of the contamination present. The investigation consisted of: planning and subcontracting, field work, laboratory analysis, data management and evaluation, and reporting.

The Phase II ESA scope of work, including proposed boring locations and analytical parameters, was based on a site visit conducted on April 2, 2008; site information provided by Chicago 2016 (including a 2003 Phase I ESA completed by Vertex Engineering in June 2003); and additional historical information sources obtained by CH2M HILL (including environmental database search results, regulatory agency records, aerial photographs, and Sanborn maps). Seventy-six borings were completed, sampled, and analyzed to evaluate potential sources of subsurface impacts such as known leaking underground storage tanks (LUSTs) and historical areas of potential impacts (for example, former gasoline stations). Additional boring locations were selected to cover specific geographic areas of the site, such as the site's perimeter and central property areas. Broad spectrum chemical analyses consisting of volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls (PCBs), and metals were run to characterize the quality of site soil and groundwater.

Fieldwork was conducted in two phases from May 5 to May 14 (Phase IIa), and June 12 and June 13, 2008 (Phase IIb), and the results from the Phase IIa were used to scope and guide the the Phase IIb work. A total of 127 soil samples and 53 groundwater samples were collected for laboratory analysis between the two field efforts.

This Phase II ESA was conducted concurrent with the preparation of a draft Phase I ESA update report, prepared by Environmental Design International, Inc. (EDI). The EDI report updated a prior 2003 Phase I ESA prepared by Vertex Engineering for the site owner and summarized and condensed available site documents and historical information. Recognized environmental conditions (RECs) and other potential areas of concern identified

during the update process were targeted for evaluation as part of this Phase II ESA, and are referenced in this document as they relate to the findings of the soil and groundwater investigation results. The Phase I ESA report is being finalized concurrent with the completion of this Phase II ESA report.

This Phase II ESA identified the following constituent of concern (COC) categories at the site: VOCs, SVOCs, and metals, including mercury. Although analysis of PCBs performed as part of this investigation did not reveal the presence of PCBs, these constituents are considered potential COCs in the vicinity of onsite electrical substations that are owned and controlled by Commonwealth Edison. These areas were not specifically targeted as part of the Phase II ESA. No pesticides were detected above TACO Tier 1 residential criteria; therefore, pesticides are not considered a COC for the site. The individual COCs detected at the site are consistent with what is known regarding the history of the site use.

The Phase II ESA identified concentrations of metals (arsenic, lead, and mercury), and SVOCs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(ah)anthracene, indeno(123-cd)pyrene, naphthalene) exceeding TACO Tier 1 residential and industrial/commercial direct contact criteria (ingestion and inhalation exposure routes). Lead, arsenic, mercury, selenium, and eight SVOC compounds exceeded the TACO Soil Component of the Groundwater Ingestion Exposure Route (Class I) criteria. Approximately 21 percent of soil samples that were analyzed for lead exceeded one or more TACO exposure criteria for lead. Approximately 36 percent of soil samples that were analyzed for SVOCs exceeded one or more TACO exposure criteria for at least one SVOC compound. The detected concentration of mercury in one sample (at 97 mg/kg, Area 19, boring location I19-1) was found to exceed the TACO residential and industrial commercial inhalation criteria. Naphthalene exceeded the TACO Tier 1 construction worker inhalation criteria in soil samples from four soil borings, while mercury exceeded the TACO Tier 1 construction worker inhalation criteria in 63 of 90 (70 percent of the) soil samples collected from the site.

The data indicate widespread exceedances of TACO Tier 1 residential criteria across the site in the vicinity of identified RECs and areas of concern, including current or former UST locations. In addition, the detected concentrations of lead and SVOCs exceeding Illinois TACO Tier 1 residential criteria were found at locations across the site, and at varying depth intervals within the fill. Approximately 58 percent of the soil samples collected from the site contained an exceedance of one or more TACO Tier 1 residential criteria. A general trend of higher SVOC concentrations in the northern portions of the site, and in the vicinity of underground storage tanks (USTs) and aboveground storage tanks (ASTs) is apparent from the data, but wide variability of these TACO exceedances is apparent in the fill material making it difficult to attribute COC detections to particular potential sources or RECs.

Documents reviewed as part of the Phase II ESA show that there have been five LUST incidents at the facility, which included petroleum releases to both soil and groundwater (incident numbers 911651, 931373, 931472, 983092, and 990177). Impacts from these releases were documented to remain in the subsurface, and closures for these LUST incidents were obtained by the owner from the Illinois Environmental Protection Agency (IEPA) through the use of industrial/commercial property use restrictions, exposure pathway exclusions, and prohibitions against the use of groundwater at the site for potable purposes (via the use of an established City of Chicago groundwater ordinance). The prior LUST investigative

data and results were considered in tandem with the Phase II ESA results and are briefly discussed in this Phase II ESA, where appropriate.

Although a Class I groundwater designation has not been officially established for the site by verifying the conductivity of the shallow saturated soil, the predominant sandy nature of the geologic material at the site is expected to qualify these materials as a Class I groundwater resource under Illinois regulations. An evaluation of the groundwater data collected from the site documented TACO Tier 1, Class I groundwater criteria exceedences for lead, arsenic, chromium, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, indeno(123-cd)pyrene, and chloroform. Approximately 75 percent of the groundwater samples collected from the site contained an exceedance of one or more TACO Tier 1 residential criteria, principally for lead.

The concentrations of identified COCs exceeding the applicable TACO Tier 1 residential and industrial/commercial criteria represent potential exposure pathways for future a future residential development as well as industrial/commercial and construction worker activities on the property, as detailed in Section 3.4.

The detected soil and groundwater impacts exceeding Illinois TACO Tier 1 residential and industrial/commercial criteria will require additional investigation, reporting, monitoring, and special soil handling and disposal to complete a residential redevelopment of the site and obtain a no further remediation (NFR) letter from Illinois EPA assuming a residential property use. The existing USTs will require removal if they are taken out of service, and residual impacted soils or groundwater associated with LUST incidents will also require removal and/or related remedial activities prior to residential development.

In the event that soil in these areas will require excavation, the presence of COCs above construction worker exposure criteria would necessitate the use of worker caution advisories, site-specific safety plans and appropriate protective equipment, monitoring for vapor and dust exposures, and the supervision of a trained health and safety professional.

Significant portions of the property are covered by buildings and include other structures such as utility corridors and tunnels that were not evaluated as part of the Phase II ESA. The potential for environmental impacts from interior building conditions and related utilities and subsurface structures will need to be evaluated during future demolition and removal activities to assess the potential for impacts to subsurface soil and groundwater media.

General conclusions regarding the nature and extent of COCs relative to TACO exposure pathways have been provided for the 76 locations investigated. Given the large property size, the varied history of the 34 separate land parcels that comprise the site, and the variable nature of the site fill, it is expected that significant variances of subsurface constituent concentrations will be present in the subsurface media.

There is a high potential for the discovery of unknown conditions, as development and redevelopment proceeds, given the significant gaps in knowledge regarding historical chemical and waste management practices at the site. It is reasonable to assume that other variations, like the discovery of mercury at Area 19, will be encountered.

# 1 Site Characterization

## 1.1 Introduction

CH2M HILL, Inc. (CH2M HILL) prepared this Phase II environmental site assessment (ESA) report on behalf of Chicago 2016 for the Michael Reese Hospital facility in Chicago, Illinois. The purpose of this Phase II ESA was to identify and characterize soil and groundwater conditions that may need to be addressed (through additional characterization, management, or remediation) pursuant to proposed site redevelopment. The report documents site investigation procedures, associated results, and key findings pertaining to Michael Reese Hospital located at 2929 South Ellis Avenue, Chicago, Illinois. This ESA focuses solely on environmental conditions at the Michael Reese Hospital facility (hereafter referred to as the "property" or "site").

This report characterizes the general nature and extent of constituents of concern (COCs) in soil and groundwater at the site, based on findings at the specific boring locations selected to evaluate potential sources of subsurface impacts at the site. (Environmental conditions within the buildings [such as asbestos, chemicals, biohazards, radiological wastes] as well as those existing below buildings or in association with building utilities were specifically excluded from this evaluation).

## 1.2 Site Description

The property is located in Cook County in northeast Illinois. Figure 1 shows the general location of the property with respect to the surrounding geography. Figure 2 shows the current layout of the property, including existing buildings and surrounding properties. The 37.8-acre property with public roadways occupies a 43-acre area. According to a recent National Survey Service Inc. survey, the property is comprised of 34 different parcels.

The Prairie Shores Apartments is located directly west of the property. A separate hospital facility is located immediately north of the property. Interstate 55, commercial areas, and the McCormick Place Convention Center are located further to the north. The Chicago Transit Authority, Metra, and freight trains rail lines and convention center truck parking are located on the adjacent properties to the east. Various residential and commercial properties are located to the south.

## 1.3 Site Physical Characteristics

Site topography, geology, and hydrogeology are briefly described below.

### 1.3.1 Topography

Site topography is reported on the United States Geological Survey (USGS) 7.5-minute topographic map of the Jackson Park Quadrangle (Figure 1). Ground elevation at the site fluctuates approximately 10 feet between 595 and 605 feet mean sea level (MSL). The

southeast side of the site along Lake Park Avenue is built up with a retaining wall separating the street from the railroad tracks, which are approximately 10 to 12 feet below the street level. On the north side of the site, the parks, Administrative Service Center (ASC) Building, parking lots, and railroad tracks are generally flat. The hospital facility also includes a tunnel passageway that roughly bisects the site from north to south.

Surface water flows into the storm drains that discharge to the combined storm and sanitary sewer system and is managed by the Metropolitan Water Reclamation District of Greater Chicago. Water that infiltrates through the soil is suspected to travel east toward Lake Michigan through the unconsolidated fill material and sand layer.

### 1.3.2 Geology

Regional geology generally consists of unconsolidated glacial deposits about 50 feet thick overlying Silurian bedrock. The site is underlain by the Chicago Lake Plain sediments and the Wadsworth Till Member—a clayey gray till. The Wadsworth Till Member is a glacial till and a part of the Wedron Formation. In the Chicago area, undisturbed Chicago Lake Plain sediments are primarily fine-grained silt and clay.

A review of the soil boring logs completed prior to, and during, the site investigation shows that site soils consist of surficial fill material underlain by sandy lake deposits. Surficial granular fill and lake sediments form a relatively permeable layer approximately 20 to 30 feet thick. Borings completed to a depth of 30 feet below ground surface (bgs) show that clay is present below the fill and sandy lake sediments at approximately 25 to 30 feet bgs.

### 1.3.3 Hydrogeology

Four major groundwater aquifers are recognized in northeastern Illinois: the Pleistocene glacial drift (shallow) aquifer, Silurian dolomite aquifer, Cambro-Ordovician aquifer, and Cambrian Mt. Simon sandstone aquifer. Historical site information indicated shallow groundwater generally flows northeast toward Lake Michigan. Unless disturbed or breached, the native clay underlying the shallow fill and sandy lake deposits forms an effective aquitard that inhibits significant vertical migration of shallow groundwater into the clay. Water levels measured as part of the site investigation are discussed in Section 3.2.

## 1.4 Site History

The Michael Reese Hospital facility originated as a few wooden buildings (in the 1880s) and expanded to the current size and structures by the 1980s. The hospital currently consists of 26 buildings, associated parking lots, and open space. Of the 26 buildings, eight are unoccupied.

Because the facility expanded over time, the past ownership history of the parcels is varied. The land was well developed at the time of the first records for the site (1911 Sanborn map and 1929 topographic map). Former businesses occupying portions of the current property include Keeley Brewing Company, Swigart Paper Company, H. R. Elliot & Co. Printing, several gas stations, dry cleaners, and a machine shop.

## 1.5 Recognized Environmental Conditions and Other Historic Considerations

To plan and implement this Phase II ESA, previous Phase I ESAs were reviewed and a Phase I ESA update was prepared. The Phase I ESA update report was prepared by Environmental Design International, Inc. (EDI). To support this activity, a new record review was performed, and Sanborns and topographic maps were ordered and reviewed (and are included in the Phase I ESA update report). The locations of the onsite and nearby offsite recognized environmental conditions (RECs) are shown on Figures 3 and 4, respectively.

The primary documents consulted or reviewed for the purpose of the Phase II ESA are:

- VERTEX Engineering Services, Inc. 2003. *Phase I Environmental Site Assessment Report.* June 17.
- EDI. 2008. *Phase I Environmental Site Assessment Update Report.* Draft, May 2008; Final, July 2008.

The Phase I ESA update report (EDI 2008) includes references and summaries of extensive file information that was gathered during the historical research. The above sources summarize previous environmental investigations and remediation measures and should be consulted for additional historical background and REC details.

Key findings of the Phase I ESA update report are:

- Identifying existing underground storage tanks (USTs) and five related leaking underground storage tank (LUST) incidents
- Identifying eight areas within the existing interior building structures containing exhibiting poor housekeeping and discarded biological, chemical, and pharmaceutical products
- Identifying two former dry cleaners, two former filling stations, five locations where USTs or aboveground storage tanks (ASTs) were located, two paint shops, and a machine shop.

EDI also identified four offsite RECs that had the potential to impact the site.

Additional information reviewed by CH2M HILL and considered in the Phase II ESA included the prior LUST investigation reports and the presence of at least 11 USTs that are known to be present on the property. Eight of these USTs are in use and two are documented as abandoned in place. Additionally, one UST is reported to be present beneath the ASC Building. Historical documents also indicate that nine USTs were removed from the property in the 1990s with oversight from the City of Chicago Department of Environment or the Office of the Illinois State Fire Marshal. Leaks from the UST systems were documented in seven of these removals, resulting in the recording of five LUST incidents with the Illinois Emergency Management Agency (incident numbers 911651, 931373, 931472, 983092, and 990177). In two instances, two tanks were grouped together according to LUST incident. Varying degrees of contaminated soil removal and

confirmation sampling followed the removal of these LUSTs. No further remediation (NFR) determinations have subsequently been granted by the Illinois Environmental Protection Agency (IEPA) for these five incidents. In four of the five incidents, contamination remains in place, and the approved remedy relies on engineered barriers such as a concrete or asphalt surface, an industrial/commercial use of the property, and the City of Chicago prohibition on the use of site groundwater for potable purposes to close the exposure pathway from the contamination to any potential receptors. (As a result of issuance of the NRFs, these LUSTs are considered historic RECs).

Historical documents also indicate that two gas stations and two dry cleaners were previously located on the property. No information is available regarding the quantity or status of any tanks associated with these properties. Four additional USTs were shown on the property on the 1911 or 1950 historic Sanborn maps. No documents indicating the removal of these USTs is available. The 1950 Sanborn maps identified a paint shop near the northwest corner of the Bensinger Building, a building adjoined to the General Services Building. The 1911 Sanborn maps identified a paint shop between the Bensinger Building and Main Reese Building and a machine shop near the Acute Care Building. The RECs and areas of concern identified by CH2M HILL are described in Table 1 identified by area in Table 2. The locations of onsite and nearby offsite RECs are illustrated in Figures 3 and 4, respectively. These additional areas of concern were evaluated by the borings and sampling conducted as part of this Phase II ESA.

The Phase I ESA update report and available historical information indicate that the site has the following:

- A long history of industrial and commercial site use dating back to the 1800s, including significant gaps in the historical record pertaining to historic chemical and waste handling practices that could have occurred on the various parcels that comprise the 37.8-acre site
- Five documented LUST incidents involving seven USTs, four of which involved closures of petroleum impacts in place;
- RECs, historical RECs, and other areas of concern where historical activities may have caused an impact to soil and groundwater media
- Documentation of potential interior building hazards that have the potential to affect subsurface media

## 1.6 Sampling Location Selection

The Phase II ESA scope of work, including proposed boring locations and analytical parameters, was based on a site visit conducted on April 2, 2008; site information provided by Chicago 2016 (including a 2003 Phase I ESA completed by Vertex Engineering in June 2003); and additional historical information sources obtained by CH2M HILL (including environmental database search results, regulatory agency records, aerial photographs, and Sanborn maps). Additional Phase IIb boring locations were selected based on the results of the Phase IIa sampling activities as well as the findings of the draft EDI Phase I ESA update

(May 30, 2008) and additional independent review of the Sanborn maps by CH2M HILL. (Note that this Phase II ESA was conducted in parallel with the Phase I ESA update.)

As a result of site review activities, soil and groundwater samples were collected from 76 boring locations at the following:

- Past or present facility UST and AST locations
- Historical gasoline station, machine shop, paint shop, and dry cleaner locations
- Along the property's perimeter and in central property areas not specifically associated with potential sources of site contamination to provide geographical coverage

The selected perimeter boring locations were placed nominally downgradient or side-gradient of identified offsite REC locations (assuming an easterly groundwater flow direction) to have the potential to identify impacts that could be migrating into the property.

The borings advanced during the Phase II ESA were assigned geographic area designations (Areas 1 through 20) for data presentation and evaluation purposes. Table 2 summarizes the individual boring identifiers, area designations, RECs, historical RECs, or other areas of historical activities of possible concern associated with the general area designations, as well as the sample analyses associated with each boring location. Boring locations are shown on Figure 5.

# 2 Investigation Methodology

## 2.1 Background

This Phase II ESA was conducted to assess the condition of soil and groundwater media at the site, compare the Phase II analytical results with established Illinois Tiered Approach to Corrective Action Objectives (TACO) Tier 1 cleanup criteria, and identify/characterize conditions that may require additional investigation, management, or remediation in conjunction with site redevelopment. In so doing, it also would identify COCs within site soil and groundwater that can be used to streamline future site environmental work.

Work was conducted pursuant to CH2M HILL's proposal dated May 2, 2008, and the directive from Chicago 2016 to streamline the Phase IIb effort to more broadly assess nature of the contamination present. Fieldwork was conducted in two phases from May 5 to May 14 (Phase IIa), and June 12 to 14, 2008 (Phase IIb), with the results from the Phase IIa were used to scope and guide the the Phase IIb work. A total of 127 soil samples and 53 groundwater samples were collected for laboratory analysis between the two field efforts. As stated in Section 1.6, a summary of sampling and analyses performed is provided in Table 2 and boring locations are shown on Figure 5.

Broad spectrum chemical analyses consisting of volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls (PCBs), and metals were analyzed to characterize the quality of site soil and groundwater. Soil around one transformer (T520-2 on Table 1-1) was identified for sampling, and three surface soils samples were obtained in the vicinity of this transformer and analyzed for PCBs. The remainder of the exterior electrical transformer substations owned by Commonwealth Edison were fenced and not accessible to soil sampling.

## 2.2 Field and Analytical Procedures

### 2.2.1 Field Procedures

This section describes the field procedures that CH2M HILL followed during the site investigation conducted at the property in May and June 2008.

#### Pre-Investigation Activities

Before collecting samples, Everest Engineering Company (Everest) under contract with CH2M HILL directed Raimonde Drilling Corporation (RDC) and Testing Services Corporation (TSC) in the contacting of the Chicago Utility Alert Network (DIGGER). Everest contracted TBE Group, an independent utilities locator, to locate utilities on the site near proposed boring locations. CH2M HILL representatives met with representatives of Michael Reese Hospital to locate utilities in the vicinity of proposed soil sampling locations. Investigation activities did not begin until utility locations were clearly identified. After utilities had been located, sampling locations were finalized and marked.

In the case of Areas 12, 13, and 19, three borings were located outside the property on City of Chicago right-of-way. CH2M HILL subcontractors procured permits for drilling at these locations.

During the initial site visit on April 2, 2008, several existing monitoring wells were identified at the site. These existing monitoring wells were installed for the prior LUST investigations in the 1990s and are shown on Figures 5 and 6. Because the monitoring wells had not been used for an extended time, CH2M HILL field team members and TSC drillers made an attempt to open the well cover and lid. Only five monitoring wells could be opened successfully without compromising the well completion. The status of each well was recorded in the field logbook. Table 2 includes a listing of the existing monitoring wells that were able to be opened and sampled, and Table 3 includes the water level and total depth observations for these wells.

Once each well was located and opened, the air space at the well opening was monitored with a photoionization detector (PID), and the water level and total well depth was measured. No PID readings above background levels were noted.

### Collection of Surface Soil Samples

Three surface soil samples were collected for PCBs analysis at Transformer T520-2 (Figure 5) using a hand trowel. Equipment was decontaminated prior to sampling at each designated location via the method described below. Surface soil samples were collected approximately 0 to 6 inches bgs. After collecting each soil sample, the resulting holes were backfilled with remaining cuttings, and sod was placed over the backfilled material.

### Collection of Soil Samples from Borings

Subsurface soil samples were collected using a truck or track-mounted Geoprobe® or hollow stem auger techniques. Subsurface soil samples were collected in 4-foot-long, 1.75-inch-diameter samplers with disposable acetate liners or in 24-inch-long, 2-inch-diameter split spoons. After retrieving each sample, the acetate liner or half of the split spoon was removed, and the headspace of each 1-foot depth interval was screened with a PID. No PID readings above background were recorded during the course of both subsurface sampling events. In the absence of elevated PID readings, the subsurface soil samples were collected for chemical analysis from the depth of observed visual evidence of discoloration or a specified default interval in the event that no PID readings or discoloration were observed. One to two soil samples were collected per boring, as indicated on the boring logs (Appendix A).

Each Phase IIa boring extended to 12 feet bgs, or to below the water table in the case that groundwater grab samples were being collected. During Phase IIb, each boring extended to 8 feet bgs or to below the observed water table if a groundwater grab sample was collected.

A sample for VOC analysis was obtained directly from the soil core using a disposable T-handle. The soil was placed in four 40-milliliter jars with preservatives of methyl alcohol (MeOH), sodium sulfate ($NaHSO_4$), and deionized water and one 2-ounce jar with no preservative. After collecting samples for VOC analyses, soil was extracted from the acetate liner and classified for lithology, color, and moisture content. These observations were

recorded in the field soil boring logs. Soil was then transferred into the appropriate sample containers for analysis of the remaining constituents.

After all soil samples were collected from a borehole, the hole was backfilled with the remaining soil core. If needed, bentonite chips or pellets were used to fill the remaining void. After completely backfilling the borehole, the surface was restored to asphalt in the case of boreholes that were drilled through concrete or asphalt or sod, as it was removed prior to drilling for all borings in which the borehole diameter exceeded 2 inches. Procedures for handling investigation-derived waste (IDW) are described below.

### Installation of Temporary Wells

Temporary wells were installed for collecting groundwater grab samples at 44 boring locations. Temporary wells were constructed from 1-inch inside diameter Schedule 40 polyvinyl chloride (PVC) with a 5-foot screen consisting of 0.01-inch slotted screen. Native or fill materials from the sidewalls of the borehole were allowed to collapse around the screen. Water levels or the presence of wet soil recovered in the soil core samples were noted on the boring logs and are included in the boring logs in Appendix A. Native or fill materials from soil cuttings and the sidewalls of the borehole were allowed to collapse in the borehole after the temporary well PVC and screen were pulled from the borehole. The boring was backfilled as described above.

#### *Monitoring Well Development*

Five existing monitoring wells that could be opened were developed prior to sampling using a combination of surging throughout the well screen and vigorously pumping to set the sand pack and remove fine-graded materials. Wells were pumped using a fixed 1-gallon per minute discharge rate until the well purge water cleared up or 3 well volumes were purged. Approximately 6 to 8 gallons of water were purged from each of five existing wells.

### Water Level Measurement

Water level measurements at the five accessible existing wells were collected prior to development and prior to groundwater sampling. Water level elevations (calculated using the top of casing [TOC] elevations provided in the prior LUST reports) are illustrated on Figure 7. Discussion of the shallow groundwater isocontours is presented in Section 4.

### Collection of Groundwater Samples

Well development was performed on existing monitoring wells prior to groundwater sampling. Groundwater samples were collected from the five accessible existing monitoring wells using low-flow groundwater sampling procedures as indicated in the field instructions. These procedures include low-flow purging the well at approximately 0.2 to 0.5 liter per minute and the frequent measurement of water quality parameters until the parameters stabilized within specific criteria:

- pH: within 10 percent
- Specific conductance: within 3 percent
- Dissolved oxygen: within 10 percent
- Turbidity: within 10 percent or as low as practicable given sampling conditions
- Oxidation-reduction potential: within 10 millivolts

The groundwater grab samples (from Phase IIa temporary wells) were collected using a peristaltic pump and tubing for initial screening purposes. Low-flow sampling procedures were used to stabilize parameters, particularly turbidity, to reduce the potential presence of particulates in the samples.

## Collection of Quality Control Samples

### *Trip Blanks*

Trip blanks were analyzed to assess the possibility for VOC contamination that could occur during sample shipment. Trip blanks were provided by the subcontracted laboratory. The trip blanks consisted of American Standards and Testing Methods Type I water purged with nitrogen to eliminate VOCs and preserved in hydrochloric acid. One set of trip blanks accompanied each sample cooler containing one or more VOC samples.

### *Field Duplicates*

Field duplicate samples were collected and analyzed to determine the reproducibility of field sampling and analysis. Duplicate groundwater samples were collected immediately after collecting the regular sample at a well. Duplicate samples were stored and analyzed in the same manner as the field samples. Approximately one field duplicate sample was collected per every 20 field samples.

### *MS/MSD*

Matrix spike/matrix spike duplicate (MS/MSD) samples were used by the subcontracted laboratory to assess the precision and accuracy of sample analytical procedures. MS/MSD samples were fortified by the laboratory in accordance with the specifications of the analytical methods. Samples were stored in the same manner and analyzed using the same methods as the field samples. The frequency of MS/MSD sample collection was approximately one for every 20 samples collected.

## Decontamination Procedures

Personnel wearing disposable nitrile gloves decontaminated soil and groundwater sampling equipment after each use according to the following procedure:

1. Wash with deionized or distilled water and laboratory-grade, nonphosphate detergent, using a brush if necessary to remove particulate matter and surface films.
2. Rinse with deionized or distilled water.
3. Wrap in aluminum foil, if appropriate, to prevent contamination if equipment was going to be stored and transported.

Drill rig augers and soiled portions of the drilling rig were decontaminated using a steam cleaner, and split spoons and core barrels were decontaminated by manual scrubbing with nonphosphate detergent solution and a potable water rinse. Acetate liners used for soil sampling were not reused and did not require decontamination. Water used in the decontamination process was containerized for disposal as IDW. Procedures for handling IDW are described below.

### *Sample Management Procedures*

Soil and groundwater samples collected at the property were placed in laboratory-grade containers, which were provided by Grace Analytical Laboratories of Berkeley, Illinois. Sample containers were labeled with the following information:

- Sample location number
- Depth interval
- Date and time of collection
- Initials of sampler
- Requested laboratory analysis

Samples were named with the following manner. The key elements in the sample identifier are:

- Site name: CS (for Confidential Site)
- Location identification (that is, U2)
- Matrix: GW for groundwater, SS for surface soil, or SO for subsurface soil
- Date for groundwater samples
- Depth for surface and subsurface soil samples: four digits – two for the top depth and two for the base depth (to the nearest foot)

  Example: A groundwater sample collected at boring location U1-1 on May 18, 2008 would be CS-U1-1-GW-051808.

  Example: A surface soil sample taken at location P5-2 at a depth of 4 to 6 feet bgs would be CS-P5-2-SS-0406.

Samples were placed in ice-filled coolers immediately after collection. Laboratory chain-of-custody forms were updated after each soil sample was collected. Soil samples, along with completed chain-of-custody forms, were delivered to Grace Analytical Laboratory for analysis.

## Handling of Investigation Derived Waste

IDW generated during the investigation consisted of acetate liners, decontamination water, excess soil cuttings, purge groundwater, and personal protective equipment (PPE). PPE, acetate liners, and temporary well PVC was disposed of in the general trash onsite by the field team after removing residual soil material, rinsing where appropriate, and careful inspection to ensure cleanliness of the items disposed. Soil cuttings were returned to the boring of origin after sample collection and soil classification. Decontamination water, purge water, and excess soil cuttings were placed in separate labeled drums daily during the course of the investigation. Five drums of IDW material were placed at the ASC Building loading dock, under the direction of a MRH facility representative, Jack Byrne.

During the site investigation field activities, all five drums were inspected by a Michael Reese Hospital representative to confirm the drums were appropriately stored in an area satisfactory to the facility management. The IDW materials will be stored at the designated location pending classification and disposal by Chicago 2016.

## 2.2.2 Laboratory Procedures

### Analytical Methods

Table 2 summarizes the laboratory analytical methods used to analyze the soil and groundwater samples during the Phase II ESA. Analyses were performed in accordance with requirements of 35 Illinois Administrative Code (IAC) 186 and within specified holding times. Quality control (QC) criteria as outlined in the methods and current Illinois and National Environmental Laboratory Accreditation programs have been met unless otherwise noted in the laboratory data packages. Grace Analytical Laboratory is an IEPA-certified laboratory (Grace Analytical Laboratories Accreditation #100246).

### Data Quality Objectives

The subcontracted laboratory was instructed to meet practical quantitation limits (PQLs) set forth in 35 IAC 740.415(d)(3). PQLs correspond to the lowest concentrations that a laboratory can measure within specified limits of precision and accuracy. Illinois TACO criteria limits were generally met by the laboratory during the analysis. Select SVOC compounds analyzed by Method 8270C during the first phase of sampling activities exceeded the TACO established criteria limits such as 2,4,6-trichlorophenol; 2,4-dinitrophenol; 2,4-dinitrotoluene; 2,6-dinitrotoluene; and bis(2-chloroethyl)ether; however, these SVOC compounds are not specifically known to be associated with site-related hazardous materials or documented site impacts. The detection limits reported by the laboratory for these compounds are generally below the residential and industrial/ commercial ingestion and inhalation criteria, and therefore the data are useful for Phase II ESA screening purposes. The data summary tables included in this Phase II ESA report do not highlight (that is, shade as an exceedance) instances where theses SVOC compounds were flagged as "U" (that is, undetected), but the reported "U" value exceeded the lowest TACO criteria (typically occurring for the soil threat to groundwater ingestion exposure pathway criteria).

## 2.2.3 Data Verification Procedures

The site investigation data were reviewed to assess accuracy, precision, and completeness using criteria analogous to that set forth in the U.S. Environmental Protection Agency (USEPA) *Functional Guidelines for Data Review*.

A CH2M HILL chemist reviewed QC summary forms and data reports to assess the quality of the data for the intended use. The data verification and review of QC information indicates that the data are acceptable for the intended use in Phase II ESA screening and evaluation.

# 3 Findings

## 3.1 Geology and Hydrogeology

Subsurface soils encountered in site borings generally consisted of loose to medium dense sand with variable silt and gravel content and other fill materials including debris, brick, and concrete. Fill or potentially reworked native soil material was observed in each boring extending to depths ranging from 4 to 12 feet bgs. Horizontally bedded sands, indicative of lake sediments, were observed near the bottom of a few of the direct-push technology borings. As indicated previously, site investigation soil boring logs are provided in Appendix A.

Existing monitoring wells water levels (May 5–7, 2008) indicate an easterly flow direction toward Lake Michigan in the shallow groundwater (Figure 7). Saturated conditions in the Phase II borings were generally encountered between 6 and 12 feet bgs across the site and indicate the presence of a continuous groundwater unit within the sandy geologic material. Although a Class I groundwater designation has not been officially established for the site by verifying the conductivity of the saturated soil, the predominant sandy geologic material at the site is expected to qualify the shallow aquifer as a Class I groundwater resource under Illinois regulations. No injection or withdrawal wells are known to be present at the site.

## 3.2 Analytical Results

Tables 5 and 6 present a summary of the COCs detected during the Phase II ESA, including a summary of the frequency of detection, and minimum, maximum, and mean-detected concentrations. These tables include a summary of TACO exceedances by individual COC and by TACO exposure route categories. Table 7 presents a summary of COCs that exceeded TACO criteria by individual investigative area and by TACO exposure route categories. Section 3.3 discusses the general nature and extent of detected analytes, while Section 3.4 discusses the results as they compare to TACO exposure route categories. Tables 8 through 14 summarize the specific soil analytical results that exceed the individual exposure pathways including comparison to the applicable TACO Tier 1 criteria for residential exposure, industrial/commercial exposure, construction worker exposure, and residential soil to Class 1 groundwater migration exposure pathway. Complete soil sampling results are summarized in Appendix B. Constituents that were detected in groundwater are summarized in Table 15 and compared to the TACO Tier 1, Class I groundwater standards, while complete groundwater sampling results are provided in Appendix C. Laboratory data packages are included in Appendix D.

## 3.3 Nature and Extent Evaluation

This Phase II ESA further delineated the impacts near the former USTs, near the RECs outlined in the Phase I ESA, and also evaluated additional perimeter and central geographic locations of the property. The nature and extent of identified impacts are described below.

### 3.3.1 Impacts

**Soil**

A review of the detected COCs in soil shown in Table 5 documents that 21 metals, cyanide, 2 pesticides, 21 SVOCs, and 10 VOCs were detected during the Phase II ESA. A number of the metals were found in all samples analyzed. Lead was detected in all of the soil samples at concentrations ranging from 1.9 to 7,400 milligrams per kilogram (mg/kg), with a mean concentration of 81 mg/kg. By comparison, the published TACO concentration of lead for counties within metropolitan statistical areas (that is, urban areas) is 36 mg/kg, indicating elevated lead levels above typical urban concentrations across the property.

Mercury was found in 80 percent of soil samples at concentrations ranging from 0.03 to 97 mg/kg, with a mean concentration of 0.4 mg/kg. By comparison, the published TACO concentration of mercury for counties within metropolitan statistical areas is 0.06 mg/kg, indicating elevated mercury levels above typical urban concentrations across the property.

A number of metal concentrations exceeded TACO exposure criteria and are discussed in Section 3.4. Two pesticides were detected among 19 samples but at concentrations below TACO criteria.

Among the 21 detected SVOCs in soil, the majority were polycyclic aromatic hydrocarbons (PAHs) and were detected in approximately 50 percent of soil samples, with chrysene, fluoranthene, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene all detected at a frequency above 70 percent. Mean concentrations of the detected SVOCs typically ranged from 1 to 3 mg/kg, and are similar to the published TACO background values for PAHs. Several locations of elevated PAH compounds were identified during the Phase II ESA, and these were generally found near the locations of the current or past USTs, as well as former industrial portions of the property in the northern part of the site such as Areas 1, 2, 18, 4, and 8. A number of PAH concentrations exceeded TACO exposure criteria and are discussed in Section 3.4.

Among the 10 detected VOCs in soil, four of the compound are typical gasoline constituents (benzene, toluene, ethybenzene, and xylene [BTEX]), and two chlorinated solvents typically associated with painting, dry cleaning, or degreasing operations (tetrachloroethene and trichloroethene). Four additional VOCs, including chloroform were detected in site soil samples. The BTEX compounds were typically found in the vicinity of current or past UST locations in Areas 1 through 3, although low level xylene concentrations also were found near current or suspected UST locations in Areas 10, 11, 14, and 15. The two chlorinated solvent compounds were found in Areas 2, 4, 5, and 18 in the northern portion of the site. Historical offsite dry cleaners and on-site painting operations were present in these areas and may be representative of low-level impacts from these operations although a specific source cannot be identified from available information. Chloroform was found in soil samples associated with Areas 1 and 19, and may have a possible attribution to hospital operations, as it is potentially a medical-related compound.

Among the above referenced VOC compounds, none of them exceeded the most stringent TACO criteria, but are indicative of potential VOC impacts in the subsurface at the site.

**Groundwater**

A review of the detected COCs in groundwater shown in Table 6 documents that six metals, 10 PAHs, and one VOC were detected during the Phase II ESA. Lead was detected in 89 percent of the groundwater samples at concentrations ranging from 0.002 to 0.9 milligram per liter (mg/L), with a mean concentration of 0.030 mg/L. By comparison, the published TACO Class I groundwater criteria for lead is 0.0075 mg/L, while the Class II TACO groundwater criteria is 0.1 mg/L.

The detected PAHs in groundwater were found in 3 to 13 percent of groundwater samples analyzed, with the most frequently detected compound being benzo(b)fluoranthene.

Choroform was only found in one groundwater sample at location I15-1 and may be associated with hospital operations as it is potentially a medical-related compound. The location of chloroform in groundwater is downgradient of one location in Area 4 that was found to contain chloroform in soil.

Groundwater results are further discussed in Section 3.4.

### 3.3.2 Relevant Prior LUST Incident Information and Associated Impacts

Although the data from historic LUST incidents may not be representative of conditions today, they do provide valuable perspective relative to potential contamination in these areas when evaluating the results of the Phase II effort. For this reason, they are presented below.

Subsurface soil testing in April 1991 revealed that the 30,000-gallon power plant UST was leaking, as elevated total petroleum hydrocarbon (TPH) concentrations (greater than 100 mg/kg) were detected in soil borings located to the north, east and south of the UST. The UST was subsequently removed. Although the measured value cannot be ascertained because of the poor copy quality of the report, because of the shading used in the table, the most recent round of groundwater sampling (November 1995) indicates that the benzene concentration in the downgradient well exceeded 0.005 mg/L.

In August 1998, two soil borings were each advanced alongside the 1,000-gallon fuel oil UST and the 2,000-gallon UST at Klein/Kundstadter Pavilion and Rothschild Pavilion, respectfully. These four samples were analyzed for BTEX and polynuclear aromatic hydrocarbons (PAHs) and were found to contain concentrations of these contaminants below remediation objectives. The tanks were then abandoned in place.

The 6,000-gallon fuel oil UST located at Wexler/Singer Pavilion was upgraded in December 1998. Eight soil samples were obtained beneath the piping and analyzed for BTEX and PAHs to verify whether leaks had occurred from this UST system prior to its upgrade. No BTEX compounds were detected, but PAHs were measured above remediation objectives in four of the eight samples. Benzo(a)anthracene was measured between 0.386 and 3.18 mg/kg; benzo(a)pyrene between 0.290 and 2.87 mg/kg; and benzo(b)fluoranthene between 0.193 and 2.38 mg/kg. No other soil sampling was performed at this location.

Also in December 1998, the 550-gallon fuel oil UST located at the Levinson Building was removed. No release was recorded for this removal. Six sidewall and bottom samples were analyzed for BTEX and PNAs. No benzene, ethylbenzene, nor PAHs were detected in any of

the samples. Toluene was measured between 0.009 and 0.018 mg/kg in four of the six samples and xylenes were measured between 0.002 and 0.009 in all samples. These concentrations are below current TACO Tier 1 residential remediation objectives.

The 3,000-gallon fuel oil UST was also removed from the Bensinger Building in 1998. Visible petroleum staining was noted and LUST Incident 983092 was assigned to this release. An unknown quantity of soil was excavated and seven sidewall and bottom soil samples were obtained from the resultant excavation. The samples were analyzed for BTEX and PNAs. Analytical results indicated that no BTEX parameters were measured above laboratory detection limits, and PAHs were measured in three of the seven samples, albeit at concentrations below current TACO Tier 1 residential remediation objectives. Benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and benzo(k)fluoranthene were measured at concentrations between 0.180 and 0.562 mg/kg.

Although a LUST incident was not recorded during the December 1998 removals of the 3,000-gallon fuel oil UST at Baumgarten Pavilion and the 2,500-gallon UST at Blum Pavilion, subsequent BTEX and PNA analytical results of the excavation sidewalls and bottoms indicated PNA concentrations above the most stringent Tier 1 criteria. No BTEX exceedances were reported. PNA concentrations in one of the six Blum samples exceeded Tier 1 remediation objectives (ROs). Benzo(a)anthracene was measured at 2.15 mg/kg, benzo(a)pyrene at 2.42 mg/kg, benzo(b)fluoranthene at 2.92 mg/kg, dibenzo(a,h)anthracene at 0.449 mg/kg, and indeno(1,2,3-cd)pyrene was measured at 0.887 mg/kg. It is unknown where within the excavation this sample was obtained. This contamination was managed in place.

Although, no BTEX or PNA concentrations in the six Baumgarten samples exceeded Tier 1 ROs, this removal was also assigned LUST incident based on sample results. PAHs were detected in five of the six sidewall and bottom samples. Benzo(a)anthracene was measured between 0.325 and 0.690 mg/kg, benzo(a)pyrene between 0.097 and 0.613 mg/kg, and benzo(b)fluoranthene between 0.294 and 0.654 mg/kg. It is unknown where within the excavation this sample was obtained. This contamination was managed in place.

One soil boring was advance in July 1994 approximately 200 feet east of the ASC Building LUST site and analyzed for BTEX and PAHs from 1 to 3 feet bgs, 7 to 9 feet bgs, and 13 to 15 feet bgs. BTEX concentrations were measured below remediation objectives in the samples, but PNA concentrations were measured above the objectives. Benzo(a)anthracene was measured between 0.670 and 2.500 mg/kg, benzo(a)pyrene between 1.900 and 2.700 mg/kg, benzo(b)fluoranthene between 1.900 and 4.900 mg/kg, dibenzo(a,h)anthracene between 0.480 and 4.800 mg/kg, and indeno(1,2,3-cd)pyrene between 0.580 and 0.930 mg/kg. The concentrations of these compounds generally decreased with depth.

Petroleum contamination was encountered during the removal of the two gasoline USTs that were removed in the vicinity of 27th and South Ellis streets. The tanks were removed in May 1993, and a LUST incident was assigned to this site. The contaminated soil was excavated, and sidewall and bottom samples were collected and analyzed for BTEX only. Benzene contamination was detected at 0.064 mg/kg in one of the bottom samples, which is above the Tier 1 remediation objective of 0.03 mg/kg. This area was reportedly over-excavated and resampled, and the benzene concentration was subsequently measured below 0.03 mg/kg.

The above prior LUST incident information documents that petroleum releases have occurred and that residual petroleum impacts have been closed in place. Subsequent Phase II ESA data in the vicinity of these UST and LUST areas further characterize these areas.

## 3.4 Evaluation of Exposure Routes

An evaluation of the exposure routes was conducted for the soil and groundwater samples collected at the property in accordance with IEPA TACO guidance (35 IAC 742). This included a comparison of measured chemical concentrations in individual samples to Tier 1 criteria.

Exposure pathways considered for the Tier 1 comparison for site soils include incidental soil ingestion and inhalation for the residential, industrial/commercial and construction worker scenarios. The results were also compared to the soil migration to Class I groundwater standards.

Groundwater exposure pathways were considered by comparison to Tier 1 ingestion criteria for Class I groundwater standards. The evaluation of exposure pathways is summarized below.

### 3.4.1 Residential Soil Ingestion Exposure Route

Table 8 summarizes the locations of analytical results that exceed the Illinois TACO Tier 1 residential ingestion remediation objectives. The COCs exceeding the Illinois TACO Tier 1 residential ingestion remediation objectives include arsenic, lead, mercury, and several SVOCs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene). No VOCs, pesticides, or PCBs were detected above Tier 1 residential ingestion remediation objectives in any sample.

Arsenic was detected above cleanup objectives in eight soil samples (Figure 8), corresponding to the approximate locations of the former gas station at 30th and Cottage Grove streets, the interior portion of the property at 29 Street and Ellis Avenue, and near the former gasoline USTs at 27 Street and Lake Park Avenue. With the exception of boring CS-I19-1-SO-0608, all arsenic exceedences were found in shallow soils above 3 feet bgs.

The exceedance of the TACO Tier 1 residential ingestion criteria for mercury was detected in sample CS-I19-1-SO-0608, in the vicinity of South Ellis Avenue and East 29th Street.

Total lead concentrations were detected above residential ingestion standards in 20 of the 95 soil samples that were analyzed for lead, and the SVOCs were detected above ingestion standards in 45 of the 124 soil samples that were analyzed for SVOCs.

The detected concentrations of lead and SVOCs exceeding Illinois TACO Tier 1 residential criteria were found across the site and at varying depth intervals within the apparent fill soils. A general trend of higher SVOC concentrations in the northern portions of the site, and in the vicinity of USTs and ASTs is apparent from the data, but wide variability of these TACO exceedances is apparent in the fill material making it difficult to attribute COC detections to particular sources.

Direct contact with soils exceeding TACO Tier 1 residential ingestion criteria represents a potential exposure pathway for future residential development of the site.

### 3.4.2 Residential Soil Inhalation Exposure Route

Table 9 summarizes the location of analytical results that exceed the Illinois TACO Tier 1 residential inhalation remediation objectives. There is one exceedence of the Illinois TACO Tier 1 remediation objective for the residential inhalation exposure route from this investigation. The mercury concentration in soil boring CS-I19-1-SO-0608 was detected at 97 mg/kg, which is greater than the residential inhalation remediation objective of 10 mg/kg. This concentration also exceeds the industrial/commercial inhalation remediation objective. This boring is located in the vicinity of S. Ellis Avenue and E. 29th Street (Figure 8). This mercury concentration was detected between 6 and 8 feet bgs. Five borings were subsequently advanced in the vicinity of this boring during Phase IIb (borings I19-2 through I19-6), and mercury was not detected above residential inhalation remediation objectives. However, mercury concentrations above construction worker inhalation criteria were observed in four of the five additional Phase IIb borings in this area.

The concentration of mercury exceeding TACO Tier 1 residential inhalation criteria at location I19-1 represents a potential exposure pathway for future residential development of the site, particularly if subsurface structures are constructed in this area.

### 3.4.3 Construction Worker Soil Ingestion Exposure Route

Table 10 summarizes the locations of analytical results that exceed the Illinois TACO Tier 1 industrial/commercial ingestion remediation objectives. The lead concentration in four of the borings was measured above the construction worker ingestion exposure route value of 700 mg/kg. Additionally, the mercury concentration in CS-I19-1-SO-0608 was above the remediation objective of 61 mg/kg.

Figure 9 graphically displays the locations of soil results that exceed the Illinois TACO Tier 1 industrial/commercial (construction worker) values for soil inhalation and ingestion.

Direct contact with soils exceeding TACO Tier 1 construction worker ingestion criteria represents a potential exposure pathway for future construction workers.

### 3.4.4 Construction Worker Soil Inhalation Exposure Route

Table 11 summarizes the locations of analytical results that exceed the Illinois TACO Tier 1 industrial/commercial inhalation remediation objectives. The naphthalene concentration exceeded the 1.8 mg/kg construction worker exposure route value in four of the borings as shown on Figure 9, and the mercury concentration exceeded the construction worker remediation objective (0.1 mg/kg) in sixty three of ninety total samples that were analyzed for mercury across the site. Therefore, mercury concentrations across the site exceed the conservative TACO construction worker inhalation criteria. According to TACO, the TACO inhalation remediation objective for mercury only applies at sites where elemental mercury is a contaminant of concern. Based on the site use as a hospital, elemental mercury is considered a potential contaminant of concern.

Figure 9 graphically displays the locations of soil results that exceed the Illinois TACO Tier 1 industrial/commercial (construction worker) values for soil inhalation and ingestion.

Mercury concentrations exceeding TACO Tier 1 industrial/commercial inhalation criteria (at numerous locations across the site) represent a potential exposure pathway for future construction workers.

### 3.4.5 Industrial/Commercial Soil Ingestion Exposure Route

As shown in Table 12, lead, arsenic, and several SVOCs are detected throughout the site in concentrations that exceed Tier 1 industrial/commercial ingestion standards. Figure 10 graphically displays the locations of soil results that exceed the Illinois TACO Tier 1 industrial/commercial values for soil inhalation and ingestion.

The concentrations of lead, arsenic, and several SVOCs exceeding TACO Tier 1 industrial/commercial ingestion criteria represent a potential exposure pathway for future construction workers in the vicinity of these locations.

### 3.4.6 Industrial/Commercial Soil Inhalation Exposure Route

Table 13 summarizes the locations of analytical results that exceed the Illinois TACO Tier 1 industrial/commercial inhalation remediation objectives. As previously discussed, only one analyte exceeded the industrial/commercial inhalation remediation objective—the mercury concentration of 97 mg/kg in CS-I19-1-SO-0608 exceeds the 16 mg/kg remediation objective. Figure 10 graphically displays the locations of soil results that exceed the Illinois TACO Tier 1 industrial/commercial values for soil inhalation and ingestion.

The concentration of mercury exceeding TACO Tier 1 industrial/commercial inhalation criteria at location I19-1 represents a potential exposure pathway for future construction workers in the vicinity of this boring, particularly if subsurface structures are constructed in this area.

### 3.4.7 Soil Component of the Groundwater Ingestion Exposure Route

Table 14 summarizes the location of analytical results that exceed the Illinois TACO Tier 1 value for the soil component of the groundwater exposure route (Class 1). No VOC concentrations were found to exceed the soil component of the groundwater ingestion exposure route remediation objectives. Concentrations of at least one SVOC or metal contaminant, however, exceed their respective TACO Tier 1 value for the soil component of the groundwater exposure route (Class 1) in 65 of the soil samples, indicating a widespread distribution of these COCs across the site. Figure 11 graphically displays the locations of soil results that exceed the Illinois TACO Tier 1 value for the soil component of the groundwater exposure route (Class 1). Results of toxicity characteristic leaching procedure (TCLP) analysis of select samples that exhibited elevated lead, chromium, or mercury concentrations did not exceed Resource Conservation and Recovery Act hazardous waste criteria. The TCLP lead results for the samples exceeded the TACO Tier 1 soil component of the groundwater exposure route (Class 1). Mercury was not detected in the TCLP analysis.

The concentrations of SVOC and metals exceeding TACO Tier 1 soil component of the groundwater exposure route (Class 1) in 65 soil samples from locations across the site locations represents a potential exposure pathway for future groundwater use at the site. However, the City of Chicago has an IEPA approved groundwater ordinance in place that

can be used in a site closure to restrict consumption of groundwater. The use of the ordinance as a potential closure approach does not address the potential for soil to impact groundwater that may be removed from the site during construction dewatering or ongoing basement dewatering (i.e. sump) activities.

### 3.4.8 Groundwater Ingestion Exposure Route

Table 15 summarizes the locations of analytical results that exceed the Illinois TACO Tier 1 Class 1 groundwater remediation objectives. Forty six temporary groundwater monitoring wells were sampled between 5/6/08 and 6/13/08. The lead concentration exceeded the Tier 1 Class I groundwater remediation objective of 0.0075 mg/l in 26 of the 37 samples. Additionally, mercury was detected above the Class 1 groundwater remediation objective in CS-I19-1, at the same location as the mercury inhalation exceedence (boring I19-1). However, groundwater samples collected from five borings that were subsequently advanced in the vicinity of boring I19-1 during Phase IIb (borings I19-2 through I19-6) did not detect the presence of mercury in the associated groundwater samples, indicating that the mercury groundwater impacts in this area were limited in extent. Five other sampling locations across the site had detectable concentrations of mercury in groundwater that did not exceed Class I groundwater objectives (U4-1, P5-1, P5-5, U14-2, and I18-1), indicating potential low level mercury impacts across the site.

Four groundwater samples collected during the Phase II ESA exhibited concentrations of SVOCs above Class 1 groundwater remediation objectives, and one water sample (CS-P5-5) contained an arsenic and chromium above the remediation objective. Chloroform was detected in one sampling location (I5-1) above Class 1 groundwater remediation objectives. Based on the above sample results, the presence of lead exceeding Class 1 groundwater criteria is common across the site, but exceedances of the other groundwater COCs are more limited in extent. The highest detected concentration of lead in groundwater was found at location U2-2, in the immediate vicinity of the former site gasoline USTs that were previously removed. The elevated lead concentration is potentially associated with the past storage and release of leaded gasoline in this area. Prior sampling results did not indicate that lead was evaluated in the LUST closure.

The concentrations of lead, mercury, arsenic, chromium, chloroform and SVOCs (principally PAHs) exceeding TACO Tier 1 Class 1 groundwater criteria in groundwater samples from across the site represents a potential exposure pathway for future groundwater use at the site. However, the City of Chicago has an IEPA approved groundwater ordinance in place that can be used in a site closure to restrict consumption of groundwater. The use of the ordinance as a potential closure approach does not address the potential for impacted groundwater that may be removed from the site during construction dewatering or ongoing basement dewatering (i.e., sump) activities.

# 4 Conclusions

This Phase II ESA characterized site environmental quality conditions at 76 borings spread across the 37.8-acre property, producing analytical data for 127 soil samples and 53 groundwater samples. Borings were placed to evaluate potential sources of subsurface impacts such as known past LUST locations and historic areas of potential impacts (i.e. former gasoline stations), as well as borings that were intended to cover geographic areas of the site such as perimeter and central areas. The results have been used to assess conditions that may need to be addressed during site development.

## 4.1 Characterization and Criteria Exceedances

The investigation detected varying levels of metals (most notably lead and mercury), SVOCs (specifically PAHs), and BTEX and a few chlorinated VOCs in soil samples. Lead and PAHs were found at concentrations indicative of impacts at sites close to and away from prior LUST and UST sites.

Among the twenty one detected SVOCs in soil, the majority were PAHs, and were detected in approximately 50 percent of soil samples, with chrysene, fluoranthene, indeno(1,2,3-cd)pyrene, phenanthrene and pyrene all detected at a frequency above 70 percent. Mean concentrations of the detected SVOCs typically ranged from 1 to 3 mg/kg, and are similar to the published TACO background values for PAHs. A number of locations of elevated PAH compounds were identified during the Phase II ESA, and these were generally found near the locations of the current or past USTs, as well as former industrial portions of the Property in the northern part of the site such as Area 1, Area 2, Area 18, Area 4, and Area 8.

Two pesticides were detected among nineteen samples that were analyzed for pesticides, but at concentrations below TACO criteria. Although analysis of PCBs performed as part of this investigation did not reveal the presence of PCBs in three surface samples, these constituents are considered potential COCs in the vicinity of onsite electrical substations that are owned and controlled by Commonwealth Edison.

Mercury was found in 80 percent of soil samples at concentrations ranging from 0.03 to 97.0 mg/kg, with a mean concentration of 0.4 mg/kg. By comparison, the published TACO concentration of mercury for counties within metropolitan statistical areas is 0.06 mg/kg, indicating elevated mercury levels above typical urban concentrations across the Property. Mercury is not associated with a previously identified potential source.

BTEX compounds were typically found in the vicinity of current or past UST locations in Areas 1 through 3, although low level xylene concentrations were also found near current or suspected UST locations in Areas 10, 11, 14 and 15. The two chlorinated solvent compounds were found in Areas 2, 4, 5, and 18 in the northern portion of the site. Historic off-site dry cleaners and on-site painting operations were present in these areas, and may be representative of low level impacts from these operations, although a specific source cannot be identified. Chloroform was found in soil samples associated with Areas 1 and 19, and

may have a possible attribution to hospital operations as it is potentially a medical related compound.

Four groundwater samples collected during the Phase II ESA exhibited concentrations of SVOCs above Class 1 groundwater remediation objectives, and one water sample (CS-P5-5) contained an arsenic and chromium above the remediation objective. Chloroform was detected in one sampling location (I5-1) above Class 1 groundwater remediation objectives.

The lead concentration exceeded the Tier 1 Class I groundwater remediation objective of 0.0075 mg/l in 26 of the 376 samples. Additionally, mercury was detected above the Class 1 groundwater remediation objective in CS-I19-1, at the same location as the mercury inhalation exceedence (boring I19-1). However, groundwater samples collected from five borings that were subsequently advanced in the vicinity of boring I19-1 during Phase IIb (borings I19-2 through I19-6) did not detect the presence of mercury in the associated groundwater samples, indicating that the mercury groundwater impacts in this area were limited in extent. Five other sampling locations across the site had detectable concentrations of mercury in groundwater that did not exceed Class I groundwater objectives (U4-1, P5-1, P5-5, U14-2, and I18-1), indicating potential low level mercury impacts across the site. Based on the above sample results, the presence of lead exceeding Class 1 groundwater criteria is common across the site, but exceedances of the other groundwater COCs are more limited in extent. Other than one detection of chloroform, no VOCs were detected in groundwater.

Although a Class I groundwater designation has not been officially established for the site by verifying the conductivity of the shallow aquifer, the predominant sandy geologic material at the site is expected to qualify the shallow saturated soil as a Class I groundwater resource under Illinois regulations. An evaluation of the groundwater data collected from the site documented Tier 1, Class I groundwater criteria exceedences for lead, arsenic, chromium, six SVOCs, and chloroform.

The study identified the following constituents above TACO Tier 1 residential and industrial/commercial direct contact criteria (ingestion and inhalation exposure routes):

- Metals: arsenic, lead, and mercury
- SVOCs: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k) fluoranthene, chrysene, dibenz(ah)anthracene, indeno(123-cd)pyrene, naphthalene)

In addition to the above COCs, detected selenium and carbazole concentrations exceeded the TACO Soil Component of the Groundwater Ingestion Exposure Route (Class I) criteria.

## 4.2 Implications for Site Development

The concentrations of identified COCs exceeding the applicable TACO Tier 1 residential and industrial/commercial criteria represent potential exposure pathways for future a future residential development as well as industrial/commercial and construction worker activities on the Property, as detailed in Section 3.4.

The detected soil and groundwater impacts exceeding Illinois TACO Tier 1 residential and industrial/commercial criteria will require additional investigation, reporting, monitoring, and special soil handling and disposal in order to complete a residential re-development of

the site and obtain a no further remediation (NFR) letter from Illinois EPA assuming a residential property use. The existing USTs will require removal if they are taken out of service, and residual impacted soils or groundwater associated with LUST incidents will also require removal and/or related remedial activities prior to residential development.

In the event that soils in these areas will require excavation, the presence of COCs above construction worker exposure criteria would necessitate the use of worker caution advisories, site specific safety plans and appropriate protective equipment, monitoring for vapor and dust exposures, and the supervision of a trained health and safety professional.

Significant portions of the property are covered by buildings and include other structures such as utility corridors and tunnels that were not evaluated as part of the Phase II ESA. The potential for environmental impacts from interior building conditions and related utilities and subsurface structures will need to be evaluated during future demolition and removal activities in order to assess the potential for impacts to subsurface soil and groundwater media.

General conclusions regarding the nature and extent of COCs relative to TACO exposure pathways have been provided for the 76 locations investigated. Given the large property size, the varied history of the 34 separate land parcels that make up the site, and the variable nature of the site fill, it is expected that significant variances of subsurface constituent concentrations will be present in the subsurface media.

There is a high potential for the discovery of unknown conditions, as development and redevelopment proceeds, given the significant gaps in knowledge regarding historic chemical and waste management practices at the site. It is reasonable to assume that other variations, like the discovery of mercury at Area 19, will be encountered.

# Tables

TABLE 1
Listing of Potential Sources (RECs, Historic RECs, and Other Historic Activities of Potential Interest)
*Phase II ESA, Michael Reese Hospital Site, Chicago, Illinois*

| Item of Interest | Location | REC Determination | Note |
|---|---|---|---|
| 6,000-gallon UST, in use | Wexler/Singer Pavilion | Yes. Tank and piping leak detection upgraded. BTEX, PAHs sampled along piping runs (~100 ft). Documented PNA release beneath product piping to building. | This area was investigated during Phase II ESA. |
| 30,000-gallon UST, in use | Power Plant | Yes. Documented release. LUST Incident 911651. TPH > 100 ppm north, south, and west of building. This area of contamination approximately 600' x 300'. Engineered barrier, institutional controls required. Benzene above Tier 1 Class 1 RO in downgradient MW near east property boundary. | This area was investigated during Phase II ESA. |
| 1,000-gallon UST, removed | ASC | Yes. Documented release. LUST Incident 931472. Engineered barrier, institutional controls required PAHs in soil in ASC-5. Downgradient (1-3, 7-9' bgs), PAHs above Class I in MW ASC-5 downgradient. | This area was investigated during Phase II ESA. |
| 3,000-gallon UST, removed | 27th and Lake Park Ave (27th and Ellis) | Yes. Documented release. LUST Incident 931373. | This area was investigated during Phase II ESA. |
| 7,500-gallon UST, removed | 27th and Lake Park Ave (27th and Ellis) | Yes. Documented release. LUST Incident 931373. | This area was investigated during Phase II ESA. |
| 2,500-gallon UST, in use | Blum | Yes. Documented release. LUST Incident 990177. Six BTEX, PAH soil samples collected & analyzed by EMPE. No BTEX exceedance, two samples with PAHs above Tier 1 residential. No sample location figure or further investigation documented. Engineered barrier required, industrial/commercial required. | This area was investigated during Phase II ESA. |
| 3,000-gallon UST, in use | Baumgarten | Yes. Documented release. LUST Incident 990177. Engineered barrier required; industrial/commercial required. | This area was investigated during Phase II ESA. |
| 3,000-gallon UST, in use | GSB/Bensinger | Yes. Documented release. LUST Incident 983092. Seven BTEX, PAH soil samples collected & analyzed by EMPE. No BTEX or PAH exceedances. No sample location figure or further investigation documented. Some PAHs left. Engineered barrier required, industrial/commercial required. | This area was investigated during Phase II ESA. |
| Machine shop with gas engine | Cottage Grove & 29th | Yes | This area was investigated during Phase II ESA. |
| 200-gallon gasoline UST | Brewery Ave & 27th | Yes. | This area was investigated during Phase II ESA. |
| Paint spraying area | West of Michael Reese (MR) laundry | Yes. | This area was investigated during Phase II ESA. |
| 250-gallon gasoline UST | S. Iglehart Pl and 27th | Yes. | This area was investigated during Phase II ESA. |
| Two underground Concrete Oil Tanks | S. Iglehart Pl and 27th | Yes. | This area was investigated during Phase II ESA. |
| Filling Station | 25th and S. Parkway--north of property | Yes. | This area was investigated during Phase II ESA. |
| Filling Station | NW corner of 31st & S. Ellis | Yes. | This area was investigated during Phase II ESA. |
| 1,000-gallon UST | 2920 S. Vernon--Offsite to west | Yes. | This area was investigated during Phase II ESA. |
| Filling Station | NW corner of 29th Place and Cottage Grove | Yes. | This area was investigated during Phase II ESA. |
| Oil Tanks | 27th & S. Ellis | Yes. | This area was investigated during Phase II ESA. |
| Filling Station | NW corner of 30th and Cottage Grove | Yes. | This area was investigated during Phase II ESA. |
| Dry Cleaner 1 | 2816 Cottage Grove | Yes. | This area was investigated during Phase II ESA. |
| Dry Cleaner 2 | 449 E 30th | Yes. | This area was investigated during Phase II ESA. |
| 2,000-gallon UST, closed in place | Rothschild | No. No release documented. Two sidewall soil samples obtained & analyzed in 1998. New UST installed. | This area was investigated during Phase II ESA. |
| 1,000-gallon UST, closed in place | Klein/Kundstadter Pavilion | No. No release documented. Two sidewall soil samples obtained & analyzed in 1998. | This area was investigated during Phase II ESA. |
| 550-gallon UST, in use | Levinson | No. No release documented. Six BTEX, PAH samples obtained & analyzed in 1998. | This area was investigated during Phase II ESA. |
| 2,000-gallon UST, in use | Rothschild | No. No release documented. | This area was investigated during Phase II ESA. |
| 1,000-gallon UST, in use | ASC | No. No release documented. | This area was investigated during Phase II ESA. |
| 550-gallon UST, potentially closed in place | Beneath western footprint of ASC | No. No release documented. | This area was investigated during Phase II ESA. |
| UST of unknown volume, removed | Meyer | No. No release documented. | This area was investigated during Phase II ESA. |
| Washed Fuel Co. | Lake Park and 25th--north of property | No. | This property does not appear on the Sanborn Maps after 1911 and, based on location and direction from the property, is not likely be an environmental concern. Northern property boundary was investigated during Phase II ESA. |
| 120-gallon gasoline UST #1 | 2423 S. Park Ave--north of property | No. | This property does not appear on the Sanborn Maps after 1911 and, based on location and direction from the property, is not likely be an environmental concern. Northern property boundary was investigated during Phase II ESA. |
| Paint and carpenter shop | Michael Reese Nurses home | No. | This shop was located with an enclosed building. No spills have been documented at this location. Although this use is not a REC, this area was investigated during the Phase II ESA |
| Cosmopolitan Fuel Co | 2435 S. Park Ave, north of property | No. | This property does not appear on the Sanborn Maps after 1911 and, based on location and direction from the property, is not likely be an environmental concern. Northern property boundary was investigated during Phase II ESA. |
| 120-gallon gasoline UST #2 | Hygenic Ice Co., north of property | No. | This property does not appear on the Sanborn Maps after 1950 and, based on location and direction from the property, is not likely be an environmental concern. Northern property boundary was investigated during Phase II ESA. |
| Cooper shop, Pitch kettle | Conrad Seipp Brewing Co. | No. | This shop was located with an enclosed building. No spills have been documented at this location. Although this use is not a REC, this area was investigated during the Phase II ESA |
| 120-gallon gasoline UST #3 | Carpenter shop north of Hygenic Ice Co.--north of property | No. | This property does not appear on the Sanborn Maps after 1911 and, based on location and direction from the property, is not likely be an environmental concern. Northern property boundary was investigated during Phase II ESA. |
| City Fuel Co Coal Shed | North of Hygenic Ice Co--north of property | No. | This property does not appear on the Sanborn Maps after 1911 and, based on location and direction from the property, is not likely be an environmental concern. Northern property boundary was investigated during Phase II ESA. |
| Coal Bins | South of MR boiler room (north of Main Reese) | No. | No history of spill. This area was investigated in Phase II ESA |
| Filling Station | West of Illinois Central facility (near former Cosmopolitan Fuel Co. | No. | This property does not appear on the Sanborn Maps after 1950 and, based on location and direction from the property, is not likely be an environmental concern. Northern property boundary was investigated during Phase II ESA. |
| City Truck Dumping | North of Swigart Paper Co.--north of property | No. | This property does not appear on the Sanborn Maps after 1950 and, based on location and direction from the property, is not likely be an environmental concern. Northern property boundary was investigated during Phase II ESA. |
| Auto Service | 24th and S. Parkway--north of property | No. | This property does not appear on the Sanborn Maps after 1950 and, based on location and direction from the property, is not likely be an environmental concern. Northern property boundary was investigated during Phase II ESA. |
| Oil Tanks | Sealtest Ice Cream Co, SW Corner of 24th and Lake Park--north of property | No. | Based on location and direction from the property is not likely be an environmental concern. Northern property boundary was investigated during Phase II ESA. |
| Substation #2 | West of Simon/Wexler | No. | No spills recorded. One transformer area was investigated in Phase II ESA |
| 500-gallon UST, unknown status | Unknown | No. | IEPA lists an additional 500-gallon UST registered to the property that is not accounted for in the above UST count. No information regarding the location or status of this tank is available. |

| Mercury | 10 | mg/kg | 97 |

Notes:
[1] 10 mg/kg is the TACO Tier 1 Residential Soil Inhalation Screening Limit. However, according to TACO, if elemental mercury is documented to be a contaminant of concern at the site, the 0.1 mg/kg TACO criteria for construction worker exposure may apply to the residential exposure pathway. Table 11 summarizes the sample locations that exceed the 0.1 mg/kg criterion.

[5] IEPA, TACO, Residential, Soil Component of the Groundwater Ingestion Exposure, Class 1
[6] IEPA, TACO, Industrial, Soil Component of the Groundwater Ingestion, Class 1
[7] IEPA, Non-TACO Chemical list, Residential Soil Threat to Groundwater Exposure, Class 1
[8] IEPA, TACO, Background, PAHs, Chicago
[9] IEPA, TACO, Residential, Exposure Route-Specific Values for Soils, Inhalation
[10] IEPA, TACO, Residential Ingestion Exposure
[11] IEPA, TACO, Industrial, Soil Component of the Groundwater Ingestion, Class 1
[12] MSL is the Minimum Screening Limit

U means that the analyte was not detected at a concentration above the detection limits.
J means that the analyte detected is below the quantitation limits.

[10] IEPA, TACO, Residential Ingestion Exposure
[11] IEPA, TACO, Industrial, Soil Component of the Groundwater Ingestion, Class 1
[12] MSL is the Minimum Screening Limit

U means that the analyte was not detected at a concentration above the detection limits.
J means that the analyte detected is below the quantitation limits.

[4] IEPA, TACO, Construction Worker, Exposure Route-Specific Values for Soils, Inhalation
[5] IEPA, TACO, Residential, Soil Component of the Groundwater Ingestion Exposure, Class 1
[6] IEPA, TACO, Industrial, Soil Component of the Groundwater Ingestion, Class 1
[7] IEPA, Non-TACO Chemical list, Residential Soil Threat to Groundwater Exposure, Class 1
[8] IEPA, TACO, Background, PAHs, Chicago
[9] IEPA, TACO, Residential, Exposure Route-Specific Values for Soils, Inhalation
[10] IEPA, TACO, Residential Ingestion Exposure
[11] IEPA, TACO, Industrial, Soil Component of the Groundwater Ingestion, Class 1
[12] MSL is the Minimum Screening Limit

U means that the analyte was not detected at a concentration above the detection limits.
J means that the analyte detected is below the quantitation limits.

[9] IEPA, TACO, Residential, Exposure Route-Specific Values for Soils, Inhalation
[10] IEPA, TACO, Residential Ingestion Exposure
[11] IEPA, TACO, Industrial, Soil Component of the Groundwater Ingestion, Class 1
[12] MSL is the Minimum Screening Limit

U means that the analyte was not detected at a concentration above the detection limits.
J means that the analyte detected is below the quantitation limits.
