Notes:
[1] MSL is the Minimum Screening Limit
[2] IEPA, TACO, Groundwater Remediation Objective, Class 1
U means that the analyte was not detected at a concentration above the detection limits.
J means that the analyte detected is below the quantitation limits.

Notes:
[1] MSL is the Minimum Screening Limit
[2] IEPA, TACO, Groundwater Remediation Objective, Class 1
U means that the analyte was not detected at a concentration above the detection limits.
J means that the analyte detected is below the quantitation limits.

Notes:
[1] MSL is the Minimum Screening Limit
[2] IEPA, TACO, Groundwater Remediation Objective, Class 1
U means that the analyte was not detected at a concentration above the detection limits.
J means that the analyte detected is below the quantitation limits.

Notes:
[1] MSL is the Minimum Screening Limit
[2] IEPA, TACO, Groundwater Remediation Objective, Class 1
U means that the analyte was not detected at a concentration above the detection limits.
J means that the analyte detected is below the quantitation limits.

Chicago, IL 60631

Project ID: Chicago Project
Grace Analytical Job ID: 8050701

The above referenced project was analyzed as directed on the enclosed Chain of Custody record.

Analyses were performed in accordance with requirements of 35 IAC 186(Accreditation #100246) and within holding time. Quality control criteria as outlined in the methods and current IL ELAP/NELAP have been met unless otherwise noted. QA/QC documentation and raw data will remain on file for future reference.

Request for duplications or reproductions of these analytical reports must be made in writing to GAL and signed by an authorized agent. The analytical results relate only to the samples analyzed.

Should you have any questions regarding any of the enclosed analytical data or need additional information, please contact me at (708) 449-9449 or e-mail sk@gracelabinc.com.

Sincerely,

Steven Kim
Laboratory Director
Grace Analytical Lab, Inc.

Chicago, IL 60631

Project ID: Chicago Project
Grace Analytical Job ID: 8050702

The above referenced project was analyzed as directed on the enclosed Chain of Custody record.

Analyses were performed in accordance with requirements of 35 IAC 186(Accreditation #100246) and within holding time. Quality control criteria as outlined in the methods and current IL ELAP/NELAP have been met unless otherwise noted. QA/QC documentation and raw data will remain on file for future reference.

Request for duplications or reproductions of these analytical reports must be made in writing to GAL and signed by an authorized agent. The analytical results relate only to the samples analyzed.

Should you have any questions regarding any of the enclosed analytical data or need additional information, please contact me at (708) 449-9449 or e-mail sk@gracelabinc.com.

Sincerely,

Steven Kim
Laboratory Director
Grace Analytical Lab, Inc.

Chicago, IL 60631

Project ID: Chicago Project
Grace Analytical Job ID: 8050706

The above referenced project was analyzed as directed on the enclosed Chain of Custody record.

Analyses were performed in accordance with requirements of 35 IAC 186(Accreditation #100246) and within holding time. Quality control criteria as outlined in the methods and current IL ELAP/NELAP have been met unless otherwise noted. QA/QC documentation and raw data will remain on file for future reference.

Request for duplications or reproductions of these analytical reports must be made in writing to GAL and signed by an authorized agent. The analytical results relate only to the samples analyzed.

Should you have any questions regarding any of the enclosed analytical data or need additional information, please contact me at (708) 449-9449 or e-mail sk@gracelabinc.com.

Sincerely,

Steven Kim
Laboratory Director
Grace Analytical Lab, Inc.

Dave Klatt
CH2M Hill
8501 W. Higgins Rd #300
Chicago, IL 60631

Project ID: Chicago Project
Grace Analytical Job ID: 8050804

The above referenced project was analyzed as directed on the enclosed Chain of Custody record.

Analyses were performed in accordance with requirements of 35 IAC 186(Accreditation #100246) and within holding time. Quality control criteria as outlined in the methods and current IL ELAP/NELAP have been met unless otherwise noted. QA/QC documentation and raw data will remain on file for future reference.

Request for duplications or reproductions of these analytical reports must be made in writing to GAL and signed by an authorized agent. The analytical results relate only to the samples analyzed.

Should you have any questions regarding any of the enclosed analytical data or need additional information, please contact me at (708) 449-9449 or e-mail sk@gracelabinc.com.

Sincerely,

Steven Kim
Laboratory Director
Grace Analytical Lab, Inc.

Project ID: Chicago Project
Grace Analytical Job ID: 8051201

The above referenced project was analyzed as directed on the enclosed Chain of Custody record.

Analyses were performed in accordance with requirements of 35 IAC 186(Accreditation #100246) and within holding time. Quality control criteria as outlined in the methods and current IL ELAP/NELAP have been met unless otherwise noted. QA/QC documentation and raw data will remain on file for future reference.

Request for duplications or reproductions of these analytical reports must be made in writing to GAL and signed by an authorized agent. The analytical results relate only to the samples analyzed.

Should you have any questions regarding any of the enclosed analytical data or need additional information, please contact me at (708) 449-9449 or e-mail sk@gracelabinc.com.

Sincerely,

Steven Kim
Laboratory Director
Grace Analytical Lab, Inc.

Project ID: Chicago Project
Grace Analytical Job ID: 8051301

The above referenced project was analyzed as directed on the enclosed Chain of Custody record.

Analyses were performed in accordance with requirements of 35 IAC 186(Accreditation #100246) and within holding time. Quality control criteria as outlined in the methods and current IL ELAP/NELAP have been met unless otherwise noted. QA/QC documentation and raw data will remain on file for future reference.

Request for duplications or reproductions of these analytical reports must be made in writing to GAL and signed by an authorized agent. The analytical results relate only to the samples analyzed.

Should you have any questions regarding any of the enclosed analytical data or need additional information, please contact me at (708) 449-9449 or e-mail sk@gracelabinc.com.

Sincerely,

Steven Kim
Laboratory Director
Grace Analytical Lab, Inc.

Project ID: Chicago Project
Grace Analytical Job ID: 8051303

The above referenced project was analyzed as directed on the enclosed Chain of Custody record.

Analyses were performed in accordance with requirements of 35 IAC 186(Accreditation #100246) and within holding time. Quality control criteria as outlined in the methods and current IL ELAP/NELAP have been met unless otherwise noted. QA/QC documentation and raw data will remain on file for future reference.

Request for duplications or reproductions of these analytical reports must be made in writing to GAL and signed by an authorized agent. The analytical results relate only to the samples analyzed.

Should you have any questions regarding any of the enclosed analytical data or need additional information, please contact me at (708) 449-9449 or e-mail sk@gracelabinc.com.

Sincerely,

Steven Kim
Laboratory Director
Grace Analytical Lab, Inc.

Project ID: Chicago Project
Grace Analytical Job ID: 8051501

The above referenced project was analyzed as directed on the enclosed Chain of Custody record.

Analyses were performed in accordance with requirements of 35 IAC 186(Accreditation #100246) and within holding time. Quality control criteria as outlined in the methods and current IL ELAP/NELAP have been met unless otherwise noted. QA/QC documentation and raw data will remain on file for future reference.

Request for duplications or reproductions of these analytical reports must be made in writing to GAL and signed by an authorized agent. The analytical results relate only to the samples analyzed.

Should you have any questions regarding any of the enclosed analytical data or need additional information, please contact me at (708) 449-9449 or e-mail sk@gracelabinc.com.

Sincerely,

Steven Kim
Laboratory Director
Grace Analytical Lab, Inc.

Project ID: Chicago Project
Grace Analytical Job ID: 8061301

The above referenced project was analyzed as directed on the enclosed Chain of Custody record.

Analyses were performed in accordance with requirements of 35 IAC 186(Accreditation #100246) and within holding time. Quality control criteria as outlined in the methods and current IL ELAP/NELAP have been met unless otherwise noted. QA/QC documentation and raw data will remain on file for future reference.

Request for duplications or reproductions of these analytical reports must be made in writing to GAL and signed by an authorized agent. The analytical results relate only to the samples analyzed.

Should you have any questions regarding any of the enclosed analytical data or need additional information, please contact me at (708) 449-9449 or e-mail sk@gracelabinc.com.

Sincerely,

Steven Kim
Laboratory Director
Grace Analytical Lab, Inc.

Project ID: Chicago Project
Grace Analytical Job ID: 8061302

The above referenced project was analyzed as directed on the enclosed Chain of Custody record.

Analyses were performed in accordance with requirements of 35 IAC 186(Accreditation #100246) and within holding time. Quality control criteria as outlined in the methods and current IL ELAP/NELAP have been met unless otherwise noted. QA/QC documentation and raw data will remain on file for future reference.

Request for duplications or reproductions of these analytical reports must be made in writing to GAL and signed by an authorized agent. The analytical results relate only to the samples analyzed.

Should you have any questions regarding any of the enclosed analytical data or need additional information, please contact me at (708) 449-9449 or e-mail sk@gracelabinc.com.

Sincerely,

Steven Kim
Laboratory Director
Grace Analytical Lab, Inc.

Project ID: Chicago Project
Grace Analytical Job ID: 8061303

The above referenced project was analyzed as directed on the enclosed Chain of Custody record.

Analyses were performed in accordance with requirements of 35 IAC 186(Accreditation #100246) and within holding time. Quality control criteria as outlined in the methods and current IL ELAP/NELAP have been met unless otherwise noted. QA/QC documentation and raw data will remain on file for future reference.

Request for duplications or reproductions of these analytical reports must be made in writing to GAL and signed by an authorized agent. The analytical results relate only to the samples analyzed.

Should you have any questions regarding any of the enclosed analytical data or need additional information, please contact me at (708) 449-9449 or e-mail sk@gracelabinc.com.

Sincerely,

Steven Kim
Laboratory Director
Grace Analytical Lab, Inc.

Project ID: Chicago Project
Grace Analytical Job ID: 8061304

The above referenced project was analyzed as directed on the enclosed Chain of Custody record.

Analyses were performed in accordance with requirements of 35 IAC 186(Accreditation #100246) and within holding time. Quality control criteria as outlined in the methods and current IL ELAP/NELAP have been met unless otherwise noted. QA/QC documentation and raw data will remain on file for future reference.

Request for duplications or reproductions of these analytical reports must be made in writing to GAL and signed by an authorized agent. The analytical results relate only to the samples analyzed.

Should you have any questions regarding any of the enclosed analytical data or need additional information, please contact me at (708) 449-9449 or e-mail sk@gracelabinc.com.

Sincerely,

Steven Kim
Laboratory Director
Grace Analytical Lab, Inc.

## Notes and Definitions

| | |
|---|---|
| S | Spike Recovery outside accepted recovery limits |
| QM-06 | Due to noted non-homogeneity of the QC sample matrix, the MS/MSD did not provide reliable results for accuracy and precision. Sample results for the QC batch were accepted based on LCS/LCSD percent recoveries and RPD values. |
| QM-02 | The RPD and/or percent recovery for this QC spike sample cannot be accurately calculated due to the high concentration of analyte inherent in the sample. |
| J | Analyte detected below quantitation limits |
| DET | Analyte DETECTED |
| ND | Analyte NOT DETECTED at or above the reporting limit |
| NR | Not Reported |
| dry | Sample results reported on a dry weight basis |
| RPD | Relative Percent Difference |

Chicago, IL 60631

Project ID: Chicago Project
Grace Analytical Job ID: 8061305

The above referenced project was analyzed as directed on the enclosed Chain of Custody record.

Analyses were performed in accordance with requirements of 35 IAC 186(Accreditation #100246) and within holding time. Quality control criteria as outlined in the methods and current IL ELAP/NELAP have been met unless otherwise noted. QA/QC documentation and raw data will remain on file for future reference.

Request for duplications or reproductions of these analytical reports must be made in writing to GAL and signed by an authorized agent. The analytical results relate only to the samples analyzed.

Should you have any questions regarding any of the enclosed analytical data or need additional information, please contact me at (708) 449-9449 or e-mail sk@gracelabinc.com.

Sincerely,

Steven Kim
Laboratory Director
Grace Analytical Lab, Inc.

## Notes and Definitions

| | |
|---|---|
| QM-06 | Due to noted non-homogeneity of the QC sample matrix, the MS/MSD did not provide reliable results for accuracy and precision. Sample results for the QC batch were accepted based on LCS/LCSD percent recoveries and RPD values. |
| QM-02 | The RPD and/or percent recovery for this QC spike sample cannot be accurately calculated due to the high concentration of analyte inherent in the sample. |
| J | Analyte detected below quantitation limits |
| DET | Analyte DETECTED |
| ND | Analyte NOT DETECTED at or above the reporting limit |
| NR | Not Reported |
| dry | Sample results reported on a dry weight basis |
| RPD | Relative Percent Difference |

**RE: Michael Reese Hospital – Building 1**
**2929 South Ellis Avenue**
**UST Summary**

Dear Ms. Tomas-Foster:

Carnow, Conibear & Assoc., Ltd. (Carnow Conibear) has reviewed previous environmental reports regarding the above referenced project for information concerning the presence of underground storage tanks (USTs). Carnow Conibear identified three areas (Areas 1, 2, and 3) within the parcel for the Administrative Services Building (Building 1) that have or may potentially have USTs. **Exhibit I** depicts the locations of the USTs. Site photographs are attached in **Attachment A.**

A summary of the USTs and their status are presented in **Table 1.** Additional attachments included consist of drawings and maps extracted from the Phase I ESAs reviewed for this summary.

Please call me at (312) 762-2927 or David Bremer at (312) 762-2915 should you have any questions.

Sincerely,

**CARNOW, CONIBEAR & ASSOC., Ltd.**

# Notification Form for Underground Storage Tanks

# General Information

Notification is required by state law for all underground storage tanks (USTs) that have been in use any time since January 1, 1974 and were in ground as of September 24, 1987 (other than heating oil tanks). Federal law required notification by May, 8 1986.

The primary purpose of this notification program is to locate and evaluate USTs that store or have stored petroleum or hazardous substances. It is expected that the information you provide will be based on reasonably available records, or, in the absence of such records, your knowledge, belief or recollection.

**Who must notify?** Owners of USTs are responsible for notification. Owner means:
In the case of a UST system in use on November 8, 1984, or bought into use after that date, any person who owns a UST system for storage, use of dispensing of regulated substance; and

(b) In the case of any UST system in use before November 8, 1984, but no longer in use on that date, any person who owned such UST immediately before the discontinuation of its use.

**What tanks are included?** a UST must contain or have contained a regulated substance, regulated substances include petroleum or hazardous substances.

**Are Heating Oil Tanks included?** Although Federal Law excludes these tanks used for consumptive use on the premises where stored, the state includes them, if: They are 1100 gallons or greater and were in the ground as of July 11, 1990; or they are than 110 gallons or 1100 gallons and were in the ground as of September 6, 1991. Heating oil USTs located on one and two family residences and farms are excluded.

**When to notify?** Owners of USTs other than heating oil that have been in use at any time since January 1, 1974 and were in the ground as of September 24, 1987, should be registered immediately, including USTs already removed. In the case the case of heating oil USTs, see the dates above. Any owner of newly installed UST is required to register within 30 days after product is placed in tank. Any new owner of a UST who was previously registered, is required to file an amended notification form within 30 days after acquiring ownership. There must be an amended notification on a previously filed form within 30 days of such change.

**Where to notify?** Completed notification forms should be sent to: Office of the State Fire Marshal, Division of Petroleum and Chemical Safety, 1035 Stevenson Dr., Springfield, IL 62703-4259.

**Penalties: The Office of the State Fire Marshal is requesting this information pursuant to the Gasoline Storage Act, 430 ILCS 15/4. This information is REQUIRED. Failure to provide the information can result in a fine up to $10,000 per day and a loss of registration. Additionally, under Federal Law, any owner who knowingly fails to notify or submits false information may be subject to a federal civil penalty not to exceed $10,000, plus any applicable state fines, for each tank which notification is not given or of which false information is submitted.**

# IL Notification for Underground Storage Tanks

- A separate form must be used for each site.
- If you have more than five tanks, photocopy pages 1-5 and attach to this notification form.
- Please type, or print in ink; the signature under "certification" (section IX) must be signed in Ink.

Proposed Temporary Sheet Piling Improvements
434 East 26th Street
Chicago, Illinois

## 1.0 INTRODUCTION

GSG Consultants, Inc. (GSG) completed a geotechnical investigation for the installation of temporary sheet piling for excavation activities at the property located 434 East 26th Street in Chicago, Illinois. The purpose of the investigation was to explore the subsurface conditions, to determine engineering properties of the subsurface soil, and develop design and construction recommendations for installation of the temporary sheet piling for the project.

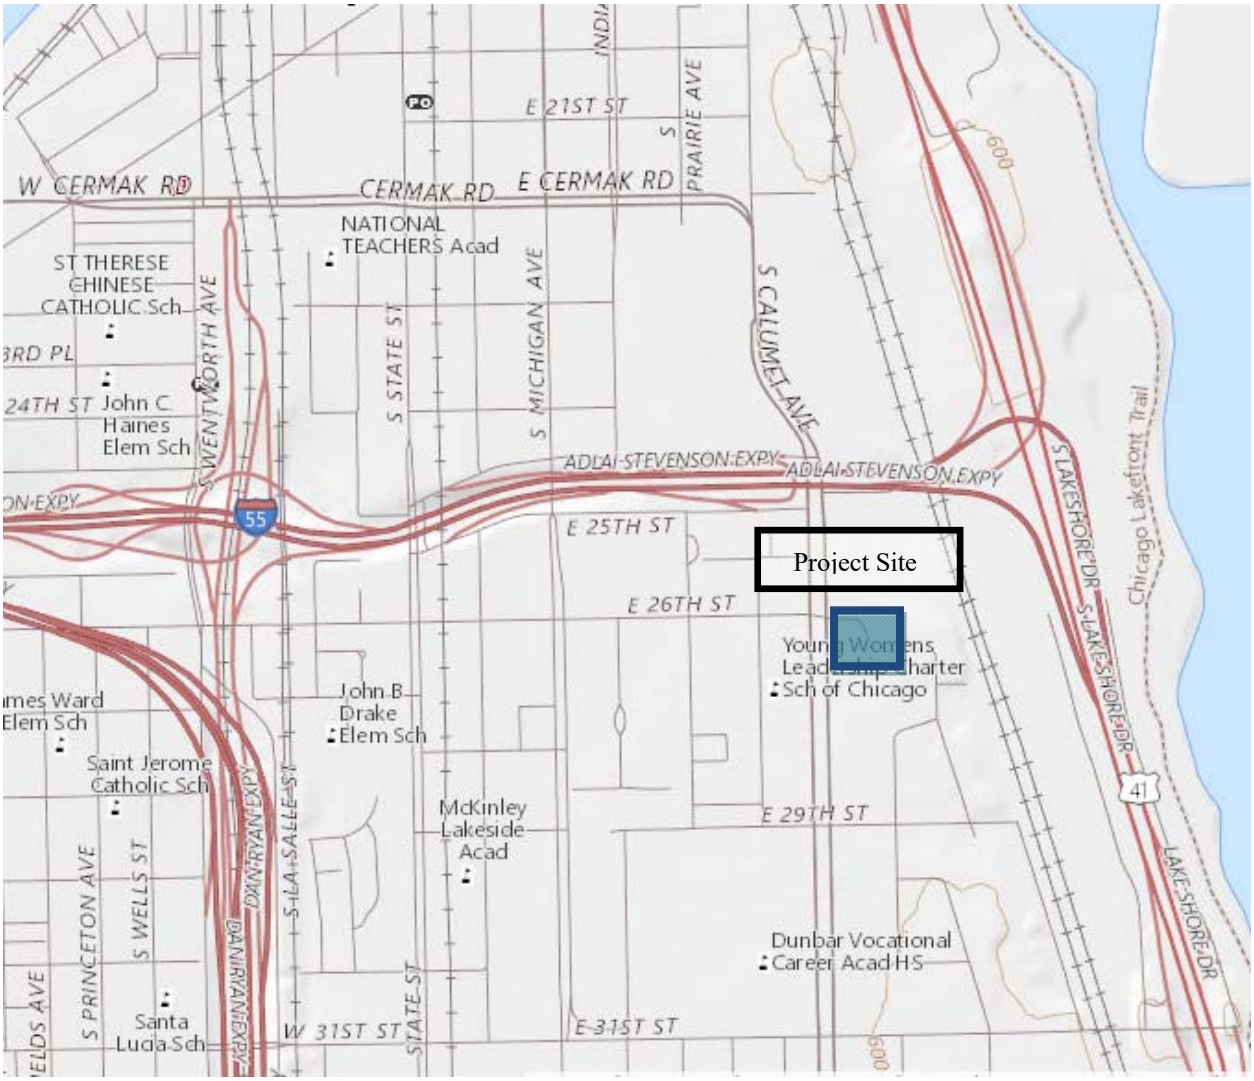

**Figure 1: Project Location Map – USGS National Map**

### 1.1 Site Conditions

The project site is currently a vacant parcel of land with a paved roadway at the north, abandoned parking and demolished building lot to the east end and a grass field to the southwest. The ground surface at the property of the proposed project is relatively flat at about an elevation of 597 to 599 feet .

### 1.2 Proposed Project Information

Based on the preliminary design information provided by Tetra Tech (client), temporary sheet pile retaining walls will be required for excavation of the soils from the site. It is anticipated that these walls would have exposed heights of approximately 15 feet to help facilitate the removal of unsuitable soils. Plans have not been provided for the approximate dimensions of the sheet piling, but the following Table 1 summarizes the assumed/approximate sheet pile wall information.

**Table 1 – Wall information Summary**

| Wall Location | Approximate Length (ft) | Maximum Exposed Wall Height (ft) | Back Slope / Front Slope |
|---|---|---|---|
| North side | 165 | 15 | Level |
| South Side | 165 | 15 | Level |
| West Side | 100 | 15 | Level |
| East Side | 100 | 15 | Level |

## 2.0 SITE SUBSURFACE EXPLORATION PROGRAM

This section describes the subsurface exploration program and laboratory testing program completed as part of this project.

### 2.1 Subsurface Exploration Program

The proposed locations and depths of the soil borings were proposed by the Tetra Tech and were completed based on field conditions and accessibility. The subsurface exploration was conducted between December 3rd thru 7th, 2018 and included advancing three (3) standard penetration test (SPT) borings near the locations of the temporary proposed walls. The borings were drilled to depths of 61.0 and 70.0 feet below existing grade. The locations of the soil borings are shown on the **Appendix A - Boring Location Map**. **Table 2** below presents a list of the borings completed for the new retaining walls.

**Table 2 – Summary of Subsurface Exploration Borings**

| Location | Soil Boring | Depth (ft) | Existing Ground Elevation in feet (in CCD) |
|---|---|---|---|
| Northwest area on 26th Street | B-1 | 61.0 | 597 (17.1 CCD) |
| Southwest area in field | B-2 | 61.5 | 598 (18.1 CCD) |
| East area in parking lot | B-3 | 70.0 | 599 (19.1 CCD) |

The soil borings were drilled using a Mobile B-57 truck mounted drill rig using 3¼-inch I.D. hollow stem augers for B-1 and B-3 and mud-rotary techniques for B-2 below a depth of 40 feet. Soil sampling was performed according to AASHTO T 206, "Penetration Test and Split Barrel Sampling of Soils." Soil samples were obtained at 2.5-foot intervals to a depth of 35 feet, and 5-foot intervals beyond that. Water level measurements were made in each boring when evidence of free groundwater was detected on the drill rods or in the samples. The boreholes were also checked for free water immediately after auger removal, and before filling the open boreholes with soil cuttings.

GSG's field representative inspected, visually classified and logged the soil samples during the subsurface exploration activities and performed unconfined compressive strength tests on cohesive soil samples using a calibrated Rimac compression tester and a calibrated hand penetrometer in accordance with IDOT procedures and requirements. Representative soil samples were collected from each sample interval and were placed in jars and returned to the laboratory for further testing and evaluation.

## 2.2 Laboratory Testing Program

All samples were inspected in the laboratory to verify the field classifications. A laboratory testing program was undertaken to characterize and determine engineering properties of the subsurface soils encountered in the area of the proposed retaining walls.

The following laboratory tests were performed on representative soil samples:

- Moisture content ASTM D2216
- Atterberg Limits ASTM D 4318
- Dry Unit Weight ASTM D7263

Based on the laboratory test results, the soils encountered were classified according to the Unified Soil Classification System (USCS). The results of the laboratory testing program are shown along with the field test results in **Appendix B, Soil Boring Logs and in Appendix C – Lab Results.**

## 2.3 Subsurface Conditions

This section provides a brief description of the soils encountered in the borings performed. Variations in the general subsurface soil profile were noted during the drilling activities. Detailed descriptions of the subsurface soils are provided in the soil boring logs.

The soil boring logs provide specific conditions encountered at each boring location. The soil boring logs include soil descriptions, stratifications, penetration resistance, elevations, location of the samples, and laboratory test data. Unless otherwise noted, soil descriptions indicated on boring logs are visual identifications. The stratifications shown on the boring logs represent the conditions only at the actual boring locations and represent the approximate boundary between subsurface materials; however, the actual transition may be gradual.

### 2.3.1 Soil Conditions

Boring B-1 noted 4 inches of asphalt and 10 inches of base course gravel at the surface (approximately 597 feet MSL) underlain by sand with gravel fill soils to a depth of 6 feet below grade. Beneath the fill, loose to medium dense sand was noted to a depth of 31 feet below grade. Following this depth, very soft to stiff fat clay was encountered to a depth of 61 feet. The fill granular soils had an SPT blow counts between 4 and 10 and the native granular soils had SPT blow counts between 4 and 15 blows. The native high plasticity fat clay soils had unconfined compressive strengths ranging from 0.2 tsf to 1.3 tsf.

Boring B-2 noted 6 inches of topsoil at the surface (approximately 598 feet MSL) underlain by sand with gravel fill soils to a depth of 6.5 feet below grade. Beneath the fill, loose to medium dense sand was noted to a depth of 29.5 feet followed by a very loose to loose silty sand to a depth of 34 feet below grade. Following this depth, a medium stiff clay was encountered to a depth of 48.5 feet followed by a stiff to very stiff silty clay to a depth of 61.5 feet. The fill granular soils had an SPT blow counts between 4 and 24 and the native granular soils had SPT blow counts between 5 and 14 blows. The native clay soils had unconfined compressive strengths ranging from 0.5 tsf to 3.75 tsf.

Boring B-3 noted sand with gravel fill soils to a depth of 3.5 feet below grade (approximately 599 feet MSL or 9.10 CCD). Beneath the fill, loose to medium dense sand was noted to a depth of 26 feet followed by a loose silty sand to a depth of 31 feet below grade. Following this depth, a soft to medium stiff clay was encountered to a depth of 39 feet followed by a soft to stiff silty clay to a depth of 63.5 feet. The boring then noted a dense to very dense silt, trace clay and limestone fragments to a depth of 70 feet. The fill granular soils had an SPT blow counts of 13 and the native granular soils had SPT blow counts between 4 and 14 blows. The native clay soils had unconfined compressive strengths ranging from 0.5 tsf to 1.0 tsf.

Boring B-1 and B2 were terminated at 61 and 61.5 feet upon encountering auger refusal on very hard silty clay soils, while boring B-3 was terminated at a deeper depth of 71 feet.

### 2.3.2 Groundwater Conditions

Water levels were checked in each boring to determine the general groundwater conditions present at the site and were measured while drilling and after each boring was completed.

Groundwater was encountered in boring B-1, B-2, and B-3 while drilling at about 18.5 feet, 8.5 feet and 13.5 feet below grade (approximate elevations of 578.5, 589.5, and 585.5 feet MSL respectively).

Based on the color change from brown to gray and the water surface elevation in the adjacent Lake Michigan, it is anticipated that the long-term groundwater level is near elevation 579 to 580 feet MSL. However, water levels at the time of drilling varied greatly from 578.5 to 589.5 feet. Water level readings were made in the boreholes at times and under conditions shown on the boring logs and stated in the text of this report. However, it should be noted that fluctuations in groundwater level may occur due to variations in rainfall, other climatic conditions, Lake Michigan water levels or other factors not evident at the time measurements were made and reported herein.

# 3.0 GEOTECHNICAL ANALYSES

This section provides GSG's geotechnical analysis and recommendations for the design of the proposed retaining walls and ramp based on the results of the initial field exploration, laboratory testing, and geotechnical analysis. Subsurface conditions in unexplored locations may vary from those encountered at the boring locations.

## 3.1 Derivation of Soil Parameters for Design

GSG determined the geotechnical parameters to be used for the project design based on the results of field and laboratory test data on individual boring logs as well as our experience. Unit weights, friction angles and shear strength parameters were estimated using standard penetration test (SPT) results for the fill and cohesion less soils and in-situ and laboratory test results for cohesive soils. The SPT values were corrected for hammer efficiency and overburden weight. The hammer efficiency correction factor considers the use of a safety hammer/rope/cat-head system, generally estimated to be 60% efficient. Thus, correlations should be based upon what is currently termed as $N_{60}$ data. GSG used a truck mounted Mobile B-57 drill rig for completing the field subsurface exploration at this site. The efficiency of the automatic hammers for the drill rig was measured to be approximately 98%, based on GSG's most recent calibrations records. The correction for hammer efficiency is a direct ratio of relative efficiencies. The following equations should be used in calculating the corrected blow counts for the purposes of design and analysis:

$$N_{60} = N_{Field} * (98/60) \text{ for Mobile B-57 drill rig}$$

Where the $N_{Field}$ value is the field recorded blow counts during drilling activities.

Table 1 presents generalized soil parameters to be used for design based on the laboratory and in-situ testing data:

**Table 3 – Summary of On-site Soil Parameters**

| Depth (Elevation, feet) | Soil Description | In situ Unit Weight γ (pcf) | Undrained | | Drained | |
|---|---|---|---|---|---|---|
| | | | Cohesion c (psf) | Friction Angle ϕ (Degrees) | Cohesion c (psf) | Friction Angle ϕ (Degrees) |
| 0.0 – 6.0 (598.0 – 592.0) | FILL: Black and Brown Sands and Gravels | 125 | 0 | 30 | 0 | 30 |
| 6.0 – 19.0 (592.0 – 579.0) | Brown and Gray Loose to Medium Dense Sand | 122 | 0 | 34 | 0 | 34 |
| 19.0 – 33.0 (579.0 – 565.0) | Gray Very Loose to Medium Dense Silty Sand | 119 | 0 | 32 | 0 | 32 |
| 33.0 – 48.0 (565.0 – 550.0) | Gray Very Soft to Medium Stiff Fat Clay | 80 | 460 | 0 | 0 | 21 |
| 48.0 – 61.0 (550.0 – 537.0) | Gray Medium Stiff to Very Stiff Fat Clay | 80 | 1,530 | 0 | 75 | 24 |
| 61.0 – 70.0 (537.0 – 528.0) | Gray Dense to Extremely Dense Silt | 140 | 0 | 40 | 0 | 40 |

# 4.0 GEOTECHNICAL RECOMMENDATIONS

This section provides recommendation regarding design parameters for the proposed sheet pile design. The recommendations were developed based on the project information provided by the Tetra Tech and the results of the site investigation. If there are any significant changes to the project characteristics or if significantly different subsurface conditions are encountered during construction, GSG should be consulted so that the recommendations of this report can be reviewed. GSG understands that the proposed temporary earth retention System will be sheet pile type. Below is a general discussion of the wall design requirements and required design parameters.

## 4.1 Sheet Pile Wall Design

Sheet pile walls are typically used in cut areas when continuous support must be provided to maintain existing structures or other adjacent facilities. To provide lateral resistance against the retained soil, the walls can be designed to act as a cantilever or can use tie backs behind the wall. The installation of sheet pile walls requires the use of specialty equipment to drive the piles into the ground. The walls maintain the existing site conditions with minimal disturbance to existing structures and can be installed relatively quickly. However, due to the presence of very stiff clays and extremely dense silts near an elevation of 530.0 feet (-49.9 feet CCD), we recommend using a heavier pile section with a minimum thickness of 0.4 inch to alleviate any damage to the pile section during driving if the sheet pile design is to extend past a depth of 55 feet below the existing surface. Grade 50 steel should be used for the sheet pile. The interlocks could be partially clogged during driving and after installation due to fine soil particle migration. The steel sheet piles may be subject to potentially corrosion. Corrosion rates are typically a function of temperature, soil pH, access to oxygen, and chemistry of the environment surrounding the pile. The walls are intended to be temporary, but if the wall is to remain in place as a long-term wall, corrosion deterioration should be considered on the sheet pile wall design.

Based on the overall wall stability, it is recommended that the cantilevered sheet pile system be installed to a minimum elevation of 550 feet (-29.9 feet CCD) with the pile section being at least 50 feet in length. GSG does not anticipate any constructability issues while driving these sheet piles, however, if an alternate system is considered then an anchored wall system may be considered. Different anchor systems such as grouted tiebacks, deadman anchor, or waler beams may be considered. The anchor system will transmit all loads from the soil through the retaining walls to the anchor and will align and brace the walls in position.

## 4.2 Lateral Earth Pressures and Loading

The wall shall be designed to withstand earth and live lateral earth pressures. The lateral earth pressures on retaining walls depend on the type of wall (i.e. restrained or unrestrained), the type of backfill and the method of placement against the wall, and the magnitude of surcharge weight on the ground surface adjacent to the wall. Sheet pile walls are considered flexible and such the earth loads may be calculated using active earth pressure for load above the design grade, and both active and passive earth pressures below the design grade. The active earth pressure coefficient ($K_a$), and the passive earth pressure coefficient ($K_p$) were determined in accordance with AASHTO Section 3.11.5.3 and 3.11.5.4, respectively.

The design should include a structural evaluation of the sheet pile section to meet applied shear and moment, and an evaluation of overturning to determine embedment depth and other design requirements. The simplified earth pressure distributions shown in the AASHTO Standard Specifications for Highway Bridges could be used for the wall design. **Table 4** also provides recommended lateral soil modulus and soil strain parameters that can be used for laterally loaded pile analysis via the p-y curve method based on the encountered subsurface conditions. The passive resistance in front of the sheet pile wall should be ignored for the upper 3.5 feet due to excavation activities and frost-heave condition.

**Table 4 - Geotechnical Lateral Design Parameters**

| Depth Elevation (feet) | Soil Description | Active Earth Pressure Coefficient ($K_a$) | Passive Earth Pressure Coefficient ($K_p$) | At Rest Earth Pressure Coefficient ($K_o$) | Lateral Modulus of Subgrade Reaction (pci) | Soil Strain ($\varepsilon_{50}$) | Adhesion ($C_a$) psf | Friction Angle between Steel and Soils (Tan δ) |
|---|---|---|---|---|---|---|---|---|
| 0.0 – 6.0 (598.0 – 592.0) | FILL: Black and Brown Sands and Gravels | 0.33 | 3.00 | 0.50 | 90 | NA | NA | 17 (0.30) |
| 6.0 – 19.0 (592.0 – 579.0) | Brown and Gray Loose to Medium Dense Sand | 0.28 | 3.53 | 0.44 | 25 | NA | NA | 17 (0.30) |
| 19.0 – 33.0 (579.0 – 565.0) | Gray Very Loose to Medium Dense Silty Sand | 0.31 | 3.25 | 0.47 | 20 | NA | NA | 14 (0.25) |
| 33.0 – 48.0 (565.0 – 550.0) | Gray Very Soft to Medium Stiff Fat Clay | 0.47 | 2.12 | 0.64 | 30 | 0.020 | 460 | NA |
| 48.0 – 61.0 (550.0 – 537.0) | Gray Medium Stiff to Very Stiff Fat Clay | 0.42 | 2.37 | 0.59 | 760 | 0.007 | 850 | NA |
| 61.0 – 70.0 (537.0 – 528.0) | Gray Dense to Extremely Dense Silt | 0.22 | 4.59 | 0.36 | 125 | NA | NA | 11 (0.20) |

Traffic and other surcharge loads should be included in the retaining wall design. A live load surcharge of 250 psf (or the equivalent weight of 2 feet soil overburden) should be applied where vehicular load is expected to act on the surface of the backfill. Heavy equipment should not be allowed closer than five (5) feet to the retaining wall to prevent inducing high lateral

earth pressures and causing wall yielding and/or other damage.

### 4.3 Excavation Base Stability

In open-cuts, it is necessary to consider the possibility of the base of the excavation failure by heaving, due to the removal of the weight of excavated soil. Heaving typically occurs in very soft or soft fat clays, as encountered in the borings, when the excavation depth is sufficiently deep enough to cause the surrounding soil to displace vertically due to a failure of the soil beneath the excavation bottom, with a corresponding upward movement of the soils in the bottom of the excavation. In fat and lean clays, heave normally does not occur unless the ratio of Critical Height to Depth of Cut approaches one. The sheet pile wall designer should check to make sure the sheet pile is sufficiently embedded in the stiffer clay soils to avoid heaving.

# 5.0 CONSTRUCTION CONSIDERATIONS

This section provides general construction consideration during construction activities at the site. Site specific information should be utilized based on site survey condition and construction phasing of the project.

## 5.1 Existing Utilities

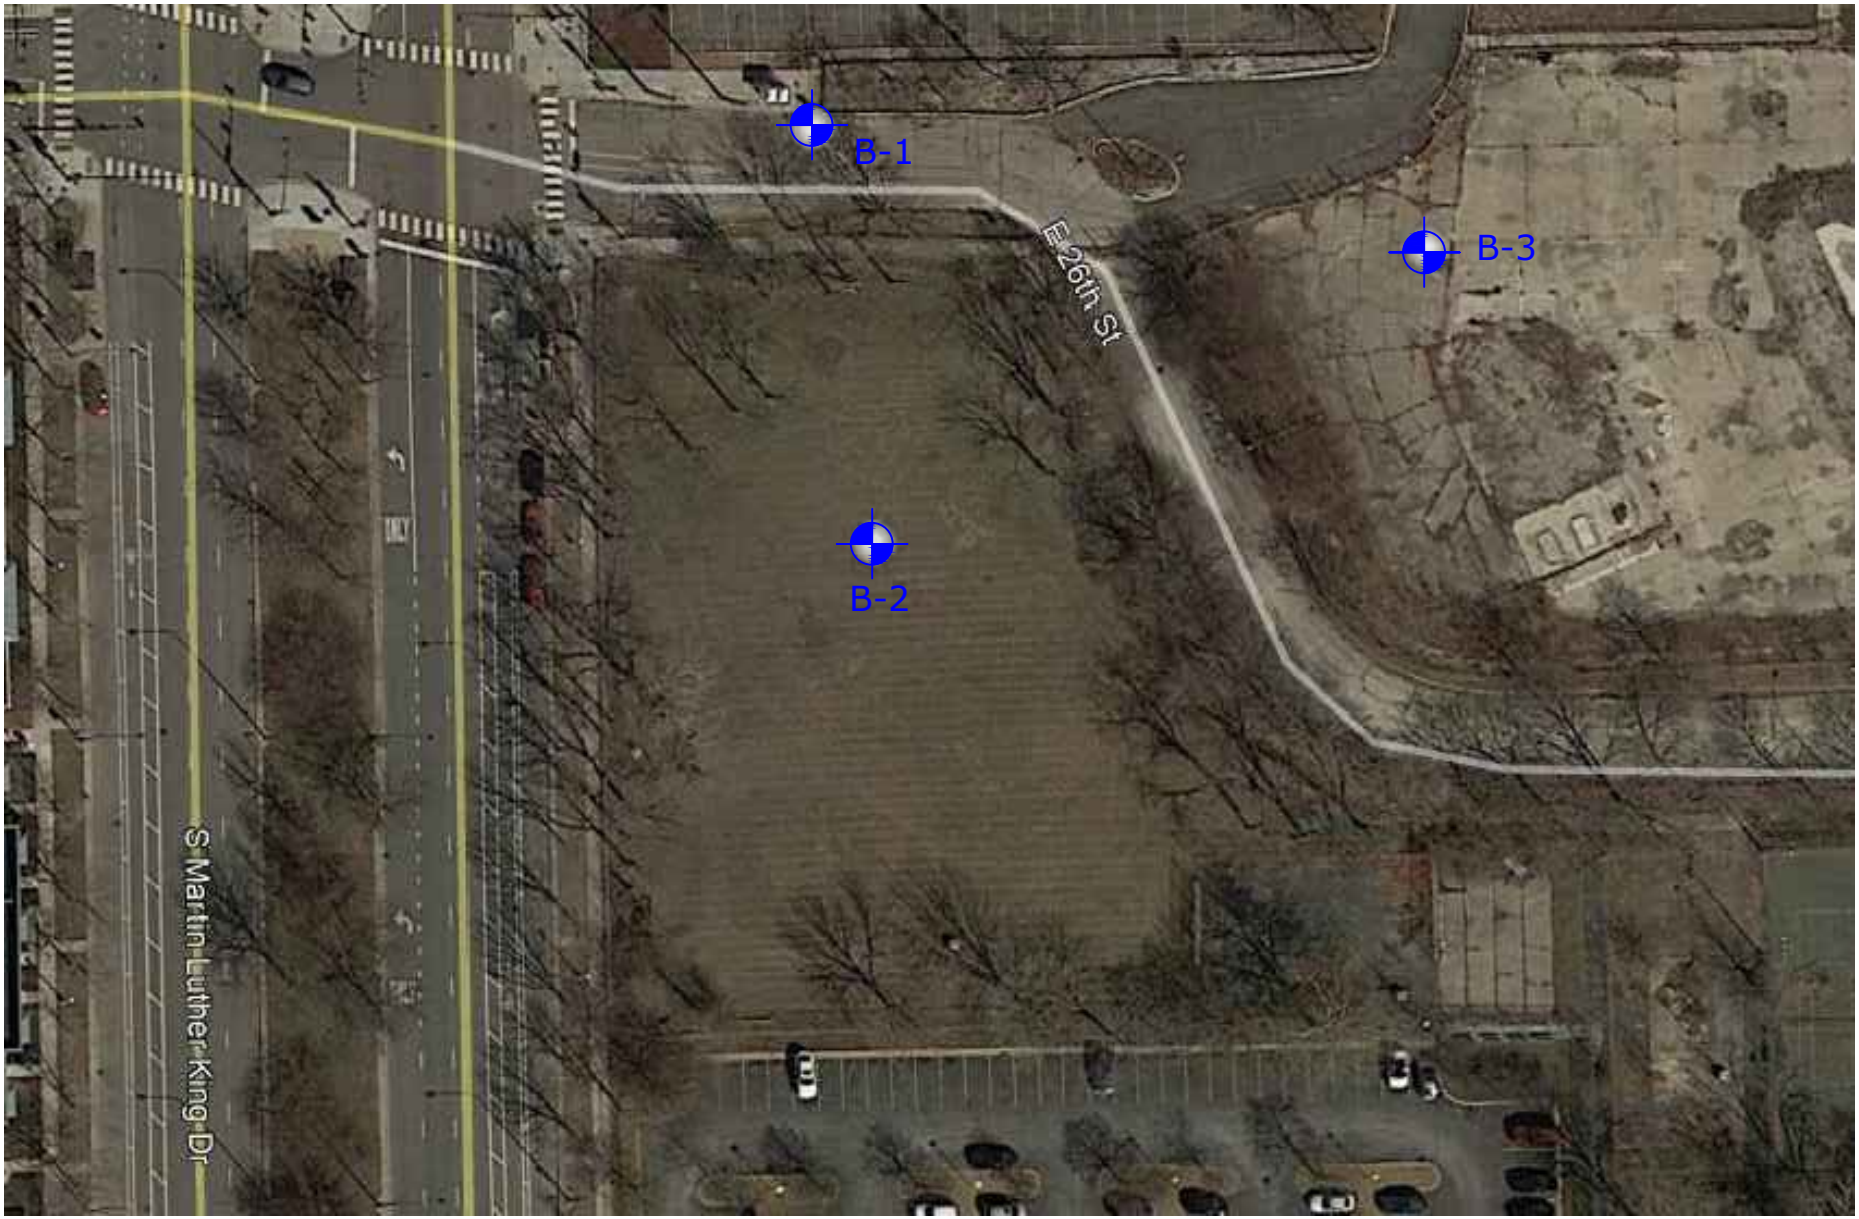
Before proceeding with construction, any existing underground utility lines that will interfere with construction should be completely rerouted or removed from beneath the proposed construction areas. Existing utility lines that are to be abandoned in place should be removed and/or plugged with a minimum of 2 feet of cement grout. All excavations resulting from underground utilities removal activities should be cleaned of loose and disturbed materials, including all previously-placed backfill, and backfilled with suitable fill materials in accordance with the requirements of this section. During the clearing and stripping operations, positive surface drainage should be maintained to prevent the accumulation of water.

## 5.2 General Excavations

The contractor will be responsible to provide a safe excavation during the construction activities of the project. All excavations should be conducted in accordance with applicable federal, state, and local safety regulations, including, but not limited to the Occupational Safety and Health administration (OSHA) excavation safety standards. Excavation stability and soil pressures on temporary shoring are dependent on soil conditions, depth of excavations, installation procedures, and the magnitude of any surcharge loads on the ground surface adjacent to the excavation. Excavation near existing structures and underground utilities should be performed with extreme care to avoid undermining existing structures. Excavations should not extend below the level of adjacent existing foundations or utilities unless underpinning or other support is installed. It is the responsibility of the contractor for field determinations of applicable conditions and providing adequate shoring for all excavation activities.

## 5.3 Groundwater Management

Based on the soil boring logs, the long-term water table is about 19 feet below the existing ground surface; however, groundwater was encountered as shallow as 8 feet during the drilling operations. It is anticipated that groundwater issues may be present at the site as the excavation is anticipated to be at a depth of 15 feet. GSG recommends that the sheet piles incorporate interlocking edges and extend thru the sandy soils into the clay soils, to act as a cutoff wall to prevent ground water from entering the site. Some water may still seep through



the interlocks of the steel sheeting, but this could be removed by normal sump pump operations. Even then well points may be required to dewater the excavation area and the contractor should provide a dewatering plan detailing how groundwater will be controlled and prevent water infiltration into the excavation/construction site.

## 6.0 LIMITATIONS

This report has been prepared for the exclusive use of 2FM and its structural consultant Tetra Tech. The recommendations provided in the report are specific to the project described herein and are based on the information obtained at the soil boring locations within the proposed retaining wall area. The analyses performed and the recommendations provided in this report are based on subsurface conditions determined at the location of the borings. This report may not reflect all variations that may occur between boring locations or at some other time, the nature and extent of which may not become evident until during the time of construction. If variations in subsurface conditions become evident after submission of this report, it will be necessary to evaluate their nature and review the recommendations presented herein.

# Unified Soil Classification

Soil Classification is based on the Unified Soil Classification System and ASTM Designations D-2487 and D-2488. Coarse Grained Soils have more than 50% of their dry weight retained on a #200 sieve; they are described as: clays, if they are plastic, and silts if they are slightly Plastic or non-plastic. Major constituents may be added as modifiers and minor constituents may be added according to the basis of their relative in-place density and fine grained soils on the basis of their consistency. Example: Lean clay with sand, trace gravel, stiff (CL); silty sand, trace gravel, medium dense (SM).

**Drilling & Sampling Symbols**

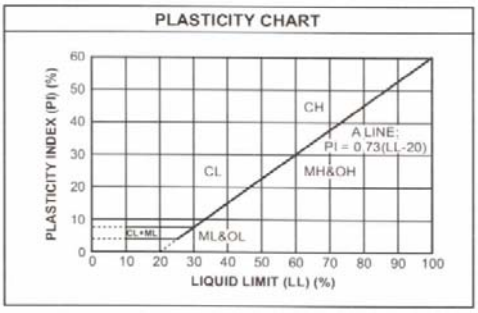
SS : Split Spoon
ST : Thin-Walled Tube
HA: Hand Auger
AU: Auger Sample
HS: Hand Sample

**Water Level (ft)**
▽ While Drilling
▽ After Drilling
▼ 24-hour

Standard "N" Penetration: Blows per foot of a 140 pound hammer falling 30 inches on a 2 inch OD split spoon, except where noted.

| Major Divisions | | | Group Symbols | Typical Names |
|---|---|---|---|---|
| Coarse Grained Soils (More than Half of material is larger than No. 200 sieve size) | Gravels (More than hall of coarse fraction is larger than No. 4 sieve size) | Clean Gravels (Little or no fines) | GW | Well graded gravels, gravel-sand mixtures, little or no fines |
| | | | GP | Poorly graded gravels, gravel-sand mixtures, little or no fines |
| | | Gravels with fines (Appreciable amount of fines) | GM d / u | Silty gravels, gravel-sand-clay mixtures |
| | | | GC | Clayey gravels, gravel-sand-clay mixtures |
| | Sands (More than hall of coarse fraction is smaller than No. 4 sieve size) | Clean Sands (Little or no fines) | SW | Well graded sands, gravelly sands, little or no fines |
| | | | SP | Poorly graded sands, gravelly sands, little or no fines |
| | | Sands with fines (Appreciable amount of fines) | SM d / u | Silty sands, sand-silt mixtures |
| | | | SC | Clayey sands, sand-clay mixtures |
| Fine Grained Soils More than half of material is smaller than No. 200 sieve size) | Silts and Clays (liquid limit less than 50) | | ML | Inorganic silts and very fine sands, rock flour, silty or claye fine sands or clayey silts with slight plasticity |
| | | | CL | Inorganic clay of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays |
| | | | OL | Organic silts and organic silty clays of low plasticity |
| | Silts and Clays (liquid limit greater than 50) | | MH | Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts |
| | | | CH | Inorganic clays of high plasticity, fat clays |
| | | | OH | Organic clays of medium to high plasticity, organic silts |
| | Highly Organic Soils | | Pt | Peat and other highly organic soils |

**Consistency of Cohesive Soil**



| Unconfined Compressive strength, Qu, tsf | N-Blows/ft. | Consistency |
|---|---|---|
| < 0.25 | Below 2 | < Very Soft |
| 0.25 - 0.50 | 2-4 | - Soft |
| 0.50 - 1.0 | 4-8 | - Medium Stiff |
| 1.0 - 2.0 | 8-15 | - Stiff |
| 2.0 - 4.0 | 15-30 | - Very Stiff |
| 4.0 - 8.0 | 30-50 | - Hard |
| > - 8.0 | > 50 | - Very Hard |

**Relative Density of Coarse-Grained Soils**

| N-Blows/ft. | Relative Density |
|---|---|
| 0-3 | Very Loose |
| 4-10 | Loose |
| 11-29 | Medium Dense |
| 30-49 | Dense |
| 50-80 | Very Dense |
| >80 | Extremely Dense |

**Description Term(s) of Components Present in Sample**

Trace < 10% Little 10-19%
Some 20-34% And 35-50%
