- Samples should be transferred into deactivated vials for handling and storage. Restek supplies deactivated vials along with most standards packed in 2 mL ampules. Due to space constraints, Restek does not supply vials for larger volume ampules. Restek sells DMDCS for the purpose of glassware deactivation as catalog number 31861, which includes complete instructions. Restek will also deactivate larger volume vials from our inventory as a custom ordered item. Contact your Restek sales or customer service representative for details.
- If any undissolved material is visible inside the ampul, sonicate the unopened ampul until the material is completely dissolved.

CERTIFIED REFERENCE MATERIAL

Certificate of Analysis

FOR LABORATORY USE ONLY-READ SDS PRIOR TO USE.

This Reference Material is intended for Laboratory Use Only as a standard for the qualitative and/or quantitative determination of the analyte(s) listed.

Catalog No.: 32415 Lot No.: A0133751
Description: Organochlorine Pesticide Mix AB #3
Organochlorine Pesticide Mix AB #3 2,000 µg/mL, Hexane/Toluene (50:50), 1mL/ampul
Container Size: 2 mL Pkg Amt: > 1 mL
Expiration Date: April 30, 2022 Storage: 10°C or colder
Handling: Sonicate prior to use.

1x 1mL
Received 8/13/18
AMB

Manufactured under Restek's ISO 9001:2015
Registered Quality System
Certificate #FM 80397

General Certified Reference Material Notes

Expiration Notes:

- Expiration date valid for unopened ampul stored in compliance with the recommended conditions.
- Uncertainty, concentration, and expiration of the CRM are based on the unopened product being stored according to the recommended condition found in the storage field.

Purity Notes:

- Purity and/or chemical identity are determined by one or more of the following techniques: GC/FID, HPLC, GC/μECD, GC/MS, LC/MS, RI, and/or melting point.
- Compounds with a listed purity of less than 99% have been weight corrected to compensate for impurities and/or salts. A correction factor is used to calculate the amount of compound necessary to achieve the desired concentration of the parent compound in solution.
- Purity of isomeric compounds is reported as the sum of the isomers.
- Purity values are rounded to the nearest whole number.

Certified Uncertainty Value Notes:

- The uncertainties are determined in accordance with ISO 17034 and Guide 35. The certified combined stressed uncertainty value (includes gravimetric uncertainty, homogeneity between-ampul uncertainty, storage stability uncertainty and shipping stability uncertainty and were combined using the following formula:

$$U_{combined\ stressed} = k \sqrt{U_{gravimetric}^2 + U_{homogeneity}^2 + U_{storage\ stability}^2 + U_{shipping\ stability}^2}$$

k is a coverage factor of 2, which gives a level of confidence of approximately 95%.

- It is important to note that the shipping stability uncertainty was obtained under temperature extremes for specific time intervals; therefore, the certified combined stressed uncertainty value should only be applied to the product if it was stored at non-standard temperature conditions up to and including 7 days. Contact Restek Technical Service at www.restek.com/Contact-Us for use recommendations if your shipment was in-transit for more than 7 days at non-standard temperature conditions.
- Apply the certified combined unstressed uncertainty value if the product was received under standard shipping conditions. Apply the certified combined stressed uncertainty value if the product was received under non-standard conditions as specified below.

Label Conditions	Standard Conditions	Non-Standard Conditions
25°C Nominal (Room Temperature)	< 60°C	≥ 60°C up to 7 days
10°C or colder (Refrigerate)	< 40°C	≥ 40°C up to 7 days
0°C or colder (Freezer)	< 25°C	≥ 25°C up to 7 days

- Separate (not combined) uncertainty values for gravimetric uncertainty are also displayed on the certificate, if needed, separate homogeneity between-ampul uncertainty, storage stability uncertainty and shipping stability uncertainty values are available by contacting Restek Technical Service at www.restek.com/Contact-Us.
- The packaged amount is the minimum sample size for which uncertainty is valid. The ampules are over-filled to ensure that the minimum packaged amount can be sufficiently transferred.

Manufacturing Notes:

- Concentration is based upon gravimetric preparation using either a balance whose calibration has been verified daily using NIST traceable weights, and/or dilutions with Class A glassware.

Handling Notes:

- Stability of the unopened product, when stored in compliance with the recommended conditions, is guaranteed through the expiration displayed on the product label and certificate. Contact Restek for additional opened product stability information, with the knowledge/understanding that open product stability is subject to the specific handling and environmental conditions to which the product is exposed. For your convenience Restek supplies deactivated vials with most standards packed in 2mL ampules. Larger volume deactivated vials are available through Restek as a custom ordered item. Additionally, Restek sells DMDCS for the purpose of glassware deactivation as catalog number 31861, which includes complete instructions.
- If any undissolved material is visible inside the ampul, sonicate the unopened ampul until the material is completely dissolved.

CERTIFICATE OF ANALYSIS

Catalog No: M-8081-DS

Description: 4,4'-DDT & Endrin

Lot: 217101288

Solvent: Hexane

Hazards: Refer to SDS for complete safety information

Date Certified: Oct 30, 2017

Expiration: Nov 30, 2018

Sample Size: 1 mL

Components: 2

Storage Condition: Ambient (>5 °C)

Included on ISO/IEC 17025 Scope of Accreditation: Yes

Included on ISO Guide 34 Scope of Accreditation: Yes

Signal Word: Danger

Component	CAS #	Purity %	Prepared Concentration ¹	Certified Analyte Concentration ²
		(GC/MS)	(µg/mL)	(µg/mL)
4,4'-DDT	50-29-3	98.2	200.6	197.0
Endrin	72-20-8	98.1	200.8	197.0

Received
03-28-18 KOK

A product with a suffix (-1A, -2B, etc. or -01, -02, etc.) on its lot number has had its expiration date extended and is identical to the same lot number without the suffix.

¹ All weights are traceable through NIST, Test No. 822-275872-11

² Certified Analyte Concentration = Purity x Prepared Concentration.

The Uncertainty associated with the certified concentration reported on this certificate is $\pm 2.4\%$. This value is the combined expanded uncertainty and represents an estimated standard deviation equal to the positive square root of the total variation of the uncertainty of components. A normal distribution is assumed and a coverage factor of K=2 is chosen using approximately a 95% confidence level.

Labels and certificates follow U.S. Conventions in reporting numerical values: A comma (,) is used to separate units of one-thousand or greater. A period (.) is used as a decimal place marker.

Hexachlorobenzene Solution

Product Number: EPA-1125

Page: 1 of 1

Lot Number: CR-5129

Lot Issue Date: 08-Nov-2017

Expiration Date: 31-Dec-2021

This ISO Guide 34 Reference Material (RM) was manufactured and verified in accordance with ULTRA's ISO 9001 registered quality system, and the analyte concentrations were verified by our ISO 17025 accredited laboratory. The true value and uncertainty value at the 95% confidence level for each analyte, determined gravimetrically, is listed below.

Analyte	CAS#	Analyte Lot	True Value
hexachlorobenzene	000118-74-1	RM03125	1003 ± 5 µg/mL

Matrix: acetone

Storage: Store at Room Temperature (15° to 30°C).

ULTRA uses balances calibrated with weights traceable to NIST in compliance with ANSI/NCSL Z-540-1 and ISO 9001, and calibrated Class A glassware in the manufacturing of these standards.

Aroclor® 1016/1260 Mix 1,000 µg/mL, Hexane, 1mL/ampul
Container Size : 2 mL Pkg Amt: > 1 mL
Expiration Date : August 31, 2022 Storage: 25°C nominal
Handling: This product contains PCBs.

CERTIFIED VALUES

Elution Order	Compound		Grav. Conc. (weight/volume)	Expanded Uncertainty (95% C.L.; K=2)				
1	Aroclor 1016	(Lot W-125-01)	1,005.0 μg/mL	+/-	5.8567	μg/mL	Gravimetric	
	CAS #			12674-11-2	+/-	31.8448	μg/mL	Unstressed
	Purity			----%	+/-	41.6041	μg/mL	Stressed
2	Aroclor 1260	(Lot W-129-06)	1,007.2 μg/mL	+/-	5.8695	μg/mL	Gravimetric

Reagent ID: 8270_LCS_Main_00060

Description: USE IN CONJUNCTION WITH 8270_LCS_S
No. of Bottles: 4
Storage Location: North Prep
Reagent Volume: 500.000 mL
Creation Date: 12/06/2018
Open Date:
Container(s):
Comment:

Expiration Date: 05/31/2019
Laboratory: TestAmerica Denver
Prepared By: Becker, Chad B
Solvent: P&T Methanol
Solvent Lot: MethanolP&T_00214

5463425, 5463426, 5463427, 5463428
Make full volume. Place all stocks in a sonication bath for 5 minutes before use.
Dilute to 500mL in P&T MeOH
40mL of MS-570666 or 571995 "8270 List 1 Std 1 MegaMix"
20mL of MS-569731 "Benzoic Acid"
10mL of "OP-572556" HCP
1 year expiration
Exchange /MeCl2 verification
All Standards in fridge.

Reagent ID: 8270Surrogate_00130

Description: 8270 Surrogate 100ug/ml
No. of Bottles: 2
Storage Location: North Prep
Reagent Volume: 1000.000 mL
Creation Date: 12/17/2018
Open Date:
Container(s): 5484310, 5484311
Comment:

Expiration Date: 12/12/2019
Laboratory: TestAmerica Denver
Prepared By: Rood, Coady M
Solvent: ACETONE
Solvent Lot: Acetone_00250

Sonicate 8270SurrStkHL 5 mins before use.
Take 20mL of 8270SurrStkHL and dilute to 1000mL in acetone.
One year expiration date.
Split into 4x250mL bottles. Requires solvent exchange to MeCl2 prior to submission for verification.

Reagent

8270SurStkHL_00299

Solvent: Methylene chloride
CAS # 75-09-2
Purity 99%

Tech Tips:

Due to the limited solubility of p-terphenyl-d14 in methanol, we do not recommend that this mixture be diluted in methanol.

Column:

30m x 0.25mm x 0.25µm
Rtx-5 (cat.#10223)

Carrier Gas:

hydrogen-constant pressure 10 psi.

Temp. Program:

40°C (hold 2 min.) to 330°C
@ 10°C/min. (hold 10 min.)

Inj. Temp:

250°C

Det. Temp:

330°C

Det. Type:

FID

This chromatogram represents a general set of testing conditions chosen for product acceptance. For optimal results in your lab, conditions should be adjusted for your specific instrument, method, and application.

General Certified Reference Material Notes

Expiration Notes:

- Expiration date valid for unopened ampul stored in compliance with the recommended conditions.
- Uncertainty, concentration, and expiration of the CRM are based on the unopened product being stored according to the recommended condition found in the storage field.

Purity Notes:

- Purity and/or chemical identity are determined by one or more of the following techniques: GC/FID, HPLC, GC/ μ ECD, GC/MS, LC/MS, RI, and/or melting point.
- Compounds with a listed purity of less than 99% have been weight corrected to compensate for impurities and/or salts. A correction factor is used to calculate the amount of compound necessary to achieve the desired concentration of the parent compound in solution.
- Purity of isomeric compounds is reported as the sum of the isomers.
- Purity values are rounded to the nearest whole number.

Certified Uncertainty Value Notes:

- The uncertainties are determined in accordance with ISO 17034 and Guide 35. The certified combined stressed uncertainty value (includes gravimetric uncertainty, homogeneity between-ampul uncertainty, storage stability uncertainty and shipping stability uncertainty and were combined using the following formula:

$$U_{combined\ stressed} = k \sqrt{U_{gravimetric}^2 + U_{homogeneity}^2 + U_{storage\ stability}^2 + U_{shipping\ stability}^2}$$

k is a coverage factor of 2, which gives a level of confidence of approximately 95%.

- It is important to note that the shipping stability uncertainty was obtained under temperature extremes for specific time intervals; therefore, the certified combined stressed uncertainty value should only be applied to the product if it was stored at non-standard temperature conditions up to and including 7 days. Contact Restek Technical Service at www.restek.com/Contact-Us for use recommendations if your shipment was in-transit for more than 7 days at non-standard temperature conditions.
- Apply the certified combined unstressed uncertainty value if the product was received under standard shipping conditions. Apply the certified combined stressed uncertainty value if the product was received under non-standard conditions as specified below.

Label Conditions	Standard Conditions	Non-Standard Conditions
25°C Nominal (Room Temperature)	< 60°C	≥ 60°C up to 7 days
10°C or colder (Refrigerate)	< 40°C	≥ 40°C up to 7 days
0°C or colder (Freezer)	< 25°C	≥ 25°C up to 7 days

- Separate (not combined) uncertainty values for gravimetric uncertainty are also displayed on the certificate, if needed, separate homogeneity between-ampul uncertainty, storage stability uncertainty and shipping stability uncertainty values are available by contacting Restek Technical Service at www.restek.com/Contact-Us.
- The packaged amount is the minimum sample size for which uncertainty is valid. The ampules are over-filled to ensure that the minimum packaged amount can be sufficiently transferred.

Manufacturing Notes:

- Concentration is based upon gravimetric preparation using either a balance whose calibration has been verified daily using NIST traceable weights, and/or dilutions with Class A glassware.

Handling Notes:

- Stability of the unopened product, when stored in compliance with the recommended conditions, is guaranteed through the expiration displayed on the product label and certificate. Contact Restek for additional opened product stability information, with the knowledge/understanding that open product stability is subject to the specific handling and environmental conditions to which the product is exposed. For your convenience Restek supplies deactivated vials with most standards packed in 2mL ampules. Larger volume deactivated vials are available through Restek as a custom ordered item. Additionally, Restek sells DMDCS for the purpose of glassware deactivation as catalog number 31861, which includes complete instructions.
- If any undissolved material is visible inside the ampul, sonicate the unopened ampul until the material is completely dissolved.

MS-47548-U_00015

Certificate of Analysis

Description: EPA 8270 GC/MS Tuning Solution II, 1x1ml, 1000µg/ml in methylene chloride

Part Number: 47548-U

Lot Number: XA19099V

Expiration Date: March 2019

Storage: Refrigerate

Analytical Method Parameters:

Column: Equity-5; 30 m x 0.53 mm, 1.5 µm df

150 °C to 280 °C (8.75 min) at 8 °C/min

Detector: FID; 310 °C

Injection Volume: 1µL

4089650
ID: MS-47548-U_00015

Analyte	Assigned Value ¹	Units	Raw Material Purity, %	Raw Material Lot No.	CAS
FAMPHUR	199 ± 6	µg/mL	98.7	LC04349	52-85-7

¹ Assigned value - the gravimetrically prepared value. Uncertainty is based on gravimetric preparation.

Traceability: The standard was manufactured under an ISO/IEC 17025:2005 certified quality system. The balance used to weigh raw materials is accurate to +/- 0.0001g and calibrated regularly using mass standards traceable to NIST. All dilutions were performed gravimetrically.

MSDS reports for components comprising greater than 1.0% of the solution or 0.1% for components known to be carcinogens are available upon request.

Robert O'Brien - Program Manager

Mark Pooler - QA Supervisor

CERTIFIED REFERENCE MATERIAL

Certificate of Analysis

FOR LABORATORY USE ONLY-READ SDS PRIOR TO USE.

This Reference Material is intended for Laboratory Use Only as a standard for the qualitative and/or quantitative determination of the analyte(s) listed.

Catalog No.: 569731 Lot No.: A0130477
 Description: 8270 List 1 / Std #10
8270 List 1 / Std #10 2,000µg/mL, Methylene chloride, 5mL/ampul
 Container Size: 5 mL Pkg Amt: > 5 mL
 Expiration Date: March 31, 2019 Storage: 10°C or colder
 Handling: This product is photosensitive.

CERTIFIED VALUES

Elution Order	Compound	Grav. Conc. (weight/volume)	Expanded Uncertainty (95% C.L.; K=2)
1	Indene	1,996.3 µg/mL	+/- 11.6064 µg/mL Gravimetric
	CAS # 95-13-6 (Lot MKBT8433V)		+/- 111.9283 µg/mL Unstressed
	Purity 98%		+/- 114.5473 µg/mL Stressed
2	Benzoic acid	2,000.8 µg/mL	+/- 11.6328 µg/mL Gravimetric
	CAS # 65-85-0 (Lot MKBV5544V)		+/- 112.1829 µg/mL Unstressed
	Purity 99%		+/- 114.8078 µg/mL Stressed
Solvent: Methylene chloride			
CAS # 75-09-2			
Purity 99%			

Reagent

MS-569731_00101

Column:

30m x 0.25mm x 0.25µm
Rtx-5 (cat.#10223)

Carrier Gas:

hydrogen-constant pressure 10 psi.

Temp. Program:

75°C (hold 1 min.) to 330°C
@ 20°C/min. (hold 10 min.)

Inj. Temp:

250°C

Det. Temp:

330°C

Det. Type:

FID

This chromatogram represents a general set of testing conditions chosen for product acceptance. For optimal results in your lab, conditions should be adjusted for your specific instrument, method, and application.

Solvent: Methylene chloride									
CAS # 75-09-2									
Purity 99%									

* Restek is unable to identify a reliable and/or acceptable second source for this material - the same batch of neat material may have been used to produce both the primary and secondary standard. The primary and secondary standards were prepared using different equipment and personnel.

Specific Reference Material Notes:

N-nitrosodiphenylamine 1000 ug/mL equivalent when used for GC analysis. Actual formulation is diphenylamine 855 ug/mL.

N-Nitrosodiphenylamine is prone to breakdown in the injection port and will be converted to diphenylamine.

N-Nitrosodiphenylamine is also a reactive species that can initiate premature decomposition of other compounds in the mix. For these reasons diphenylamine is used in the preparation of this mixture. When comparing the response of this compound to mixtures manufactured using N-nitrosodiphenylamine, a difference in response will be observed.

CERTIFIED REFERENCE MATERIAL

Certificate of Analysis

FOR LABORATORY USE ONLY-READ SDS PRIOR TO USE.

This Reference Material is intended for Laboratory Use Only as a standard for the qualitative and/or quantitative determination of the analyte(s) listed.

Catalog No. : 571995 Lot No.: A0136052
Description : 8270 List 1 / Std #1 MegaMix (2017)
8270 List 1 / Std #1 MegaMix (2017) 500-2,000µg/mL, Methylene chloride, 5mL/ampul
Container Size : 10 mL Pkg Amt: > 5 mL
Expiration Date : September 30, 2019 Storage: 0°C or colder
Handling: Carcinogen/reproductive toxin. Photosensitive. Sonicate.

5163450

ID: MS-571995_00002

Exp: 09/30/19 Pripd: OCK

Solvent: Methylene chloride CAS # 75-09-2 Purity 99%							

Specific Reference Material Notes:

N-nitrosodiphenylamine 1000 ug/mL equivalent when used for GC analysis. Actual formulation is diphenylamine 855 ug/mL.
N-Nitrosodiphenylamine is prone to breakdown in the injection port and will be converted to diphenylamine.
N-Nitrosodiphenylamine is also a reactive species that can initiate premature decomposition of other compounds in the mix. For these reasons diphenylamine is used in the preparation of this mixture. When comparing the response of this compound to mixtures manufactured using N-nitrosodiphenylamine, a difference in response will be observed.
This lot was approved even though the %D for 4,6-DN-2-MP was greater than 10%.

CERTIFIED REFERENCE MATERIAL

Certificate of Analysis

FOR LABORATORY USE ONLY-READ SDS PRIOR TO USE.

This Reference Material is intended for Laboratory Use Only as a standard for the qualitative and/or quantitative determination of the analyte(s) listed.

Catalog No. : 568718 Lot No.: A0127975

Description : 8260 Internal Standard 2014

8260 Internal Standard 2014 250-5,000 ug/ml, P&T Methanol, 5 ml/ampul

Container Size : 5 mL Pkg Amt: > 5 mL

Expiration Date : May 31, 2022 Storage: 0°C or colder

rec'd 3/1/18

General Certified Reference Material Notes

Expiration Notes:

- Expiration date valid for unopened ampul stored in compliance with the recommended conditions.
- Uncertainty, concentration, and expiration of the CRM are based on the unopened product being stored according to the recommended condition found in the storage field.

Purity Notes:

- Purity and/or chemical identity are determined by one or more of the following techniques: GC/FID, HPLC, GC/μECD, GC/MS, LC/MS, RI, and/or melting point.
- Compounds with a listed purity of less than 99% have been weight corrected to compensate for impurities and/or salts. A correction factor is used to calculate the amount of compound necessary to achieve the desired concentration of the parent compound in solution.
- Purity of isomeric compounds is reported as the sum of the isomers.
- Purity values are rounded to the nearest whole number.

Certified Uncertainty Value Notes:

- The uncertainties are determined in accordance with ISO Guides 34 and 35. The certified combined stressed uncertainty value (includes gravimetric uncertainty, homogeneity between-ampul uncertainty, storage stability uncertainty and shipping stability uncertainty and were combined using the following formula:

$$U_{combined\ stressed} = k \sqrt{U_{gravimetric}^2 + U_{homogeneity}^2 + U_{storage\ stability}^2 + U_{shipping\ stability}^2}$$

k is a coverage factor of 2, which gives a level of confidence of approximately 95%.

- It is important to note that the shipping stability uncertainty was obtained under temperature extremes for specific time intervals; therefore, the certified combined stressed uncertainty value should only be applied to the product if it was stored at non-standard temperature conditions up to and including 7 days. Contact Restek Technical Service at www.restek.com/Contact-Us for use recommendations if your shipment was in-transit for more than 7 days at non-standard temperature conditions.
- Apply the certified combined unstressed uncertainty value if the product was received under standard shipping conditions. Apply the certified combined stressed uncertainty value if the product was received under non-standard conditions as specified below.

Label Conditions	Standard Conditions	Non-Standard Conditions
25°C Nominal (Room Temperature)	< 60°C	≥ 60°C up to 7 days
10°C or colder (Refrigerate)	< 40°C	≥ 40°C up to 7 days
0°C or colder (Freezer)	< 25°C	≥ 25°C up to 7 days

- Separate (not combined) uncertainty values for gravimetric uncertainty are also displayed on the certificate, if needed, separate homogeneity between-ampul uncertainty, storage stability uncertainty and shipping stability uncertainty values are available by contacting Restek Technical Service at www.restek.com/Contact-Us.
- The packaged amount is the minimum sample size for which uncertainty is valid. The ampules are over-filled to ensure that the minimum packaged amount can be sufficiently transferred.

Manufacturing Notes:

- Concentration is based upon gravimetric preparation using either a balance whose calibration has been verified daily using NIST traceable weights, and/or dilutions with Class A glassware.

Handling Notes:

- Samples should be transferred into deactivated vials for handling and storage. Restek supplies deactivated vials along with most standards packed in 2 mL ampules. Due to space constraints, Restek does not supply vials for larger volume ampules. Restek sells DMDCS for the purpose of glassware deactivation as catalog number 31861, which includes complete instructions. Restek will also deactivate larger volume vials from our inventory as a custom ordered item. Contact your Restek sales or customer service representative for details.
- If any undissolved material is visible inside the ampul, sonicate the unopened ampul until the material is completely dissolved.

Date Passed: 13-Oct-2017

Manufactured under Restek's ISO 9001:2008 Registered Quality System Certificate #FM 80397

General Certified Reference Material Notes

Expiration Notes:

- Expiration date valid for unopened ampul stored in compliance with the recommended conditions.
- Uncertainty, concentration, and expiration of the CRM are based on the unopened product being stored according to the recommended condition found in the storage field.

Purity Notes:

- Purity and/or chemical identity are determined by one or more of the following techniques: GC/FID, HPLC, GC/μECD, GC/MS, LC/MS, RI, and/or melting point.
- Compounds with a listed purity of less than 99% have been weight corrected to compensate for impurities and/or salts. A correction factor is used to calculate the amount of compound necessary to achieve the desired concentration of the parent compound in solution.
- Purity of isomeric compounds is reported as the sum of the isomers.
- Purity values are rounded to the nearest whole number.

Certified Uncertainty Value Notes:

- The uncertainties are determined in accordance with ISO Guides 34 and 35. The certified combined stressed uncertainty value (includes gravimetric uncertainty, homogeneity between-ampul uncertainty, storage stability uncertainty and shipping stability uncertainty and were combined using the following formula:

$$U_{combined\ stressed} = k \sqrt{U_{gravimetric}^2 + U_{homogeneity}^2 + U_{storage\ stability}^2 + U_{shipping\ stability}^2}$$

k is a coverage factor of 2, which gives a level of confidence of approximately 95%.

- It is important to note that the shipping stability uncertainty was obtained under temperature extremes for specific time intervals; therefore, the certified combined stressed uncertainty value should only be applied to the product if it was stored at non-standard temperature conditions up to and including 7 days. Contact Restek Technical Service at www.restek.com/Contact-Us for use recommendations if your shipment was in-transit for more than 7 days at non-standard temperature conditions.
- Apply the certified combined unstressed uncertainty value if the product was received under standard shipping conditions. Apply the certified combined stressed uncertainty value if the product was received under non-standard conditions as specified below.

Label Conditions	Standard Conditions	Non-Standard Conditions
25°C Nominal (Room Temperature)	< 60°C	≥ 60°C up to 7 days
10°C or colder (Refrigerate)	< 40°C	≥ 40°C up to 7 days
0°C or colder (Freezer)	< 25°C	≥ 25°C up to 7 days

- Separate (not combined) uncertainty values for gravimetric uncertainty are also displayed on the certificate, if needed, separate homogeneity between-ampul uncertainty, storage stability uncertainty and shipping stability uncertainty values are available by contacting Restek Technical Service at www.restek.com/Contact-Us.
- The packaged amount is the minimum sample size for which uncertainty is valid. The ampules are over-filled to ensure that the minimum packaged amount can be sufficiently transferred.

Manufacturing Notes:

- Concentration is based upon gravimetric preparation using either a balance whose calibration has been verified daily using NIST traceable weights, and/or dilutions with Class A glassware.

Handling Notes:

- Samples should be transferred into deactivated vials for handling and storage. Restek supplies deactivated vials along with most standards packed in 2 mL ampules. Due to space constraints, Restek does not supply vials for larger volume ampules. Restek sells DMDCS for the purpose of glassware deactivation as catalog number 31861, which includes complete instructions. Restek will also deactivate larger volume vials from our inventory as a custom ordered item. Contact your Restek sales or customer service representative for details.
- If any undissolved material is visible inside the ampul, sonicate the unopened ampul until the material is completely dissolved.

4-Bromofluorobenzene Solution

Product Number: STS-110N

Page: 1 of 1

Lot Number: CH-3248Z

Lot Issue Date: 31-Aug-2016

Expiration Date: 31-Oct-2019

This ISO Guide 34 Reference Material (RM) was manufactured and verified in accordance with ULTRA's ISO 9001 registered quality system, and the analyte concentrations were verified by our ISO 17025 accredited laboratory. The true value and uncertainty value at the 95% confidence level for each analyte, determined gravimetrically, is listed below.

Analyte	CAS#	Analyte Lot	True Value
4-bromofluorobenzene	000460-00-4	RM03365	2005 ± 10 µg/mL

Matrix: methanol (methyl alcohol)

Storage: Store Frozen (-25° to -10°C).

ULTRA uses balances calibrated with weights traceable to NIST in compliance with ANSI/NCSL Z-540-1 and ISO 9001, and calibrated Class A glassware in the manufacturing of these standards.

Date Mixed: 20-Apr-2018 Balance: 1128360905
Date Passed: 24-Apr-2018

Manufactured under Restek's ISO 9001:2015
Registered Quality System
Certificate #FM 86397

General Certified Reference Material Notes

Expiration Notes:

- Expiration date valid for unopened ampul stored in compliance with the recommended conditions.
- Uncertainty, concentration, and expiration of the CRM are based on the unopened product being stored according to the recommended condition found in the storage field.

Purity Notes:

- Purity and/or chemical identity are determined by one or more of the following techniques: GC/FID, HPLC, GC/ μ ECD, GC/MS, LC/MS, RI, and/or melting point.
- Compounds with a listed purity of less than 99% have been weight corrected to compensate for impurities and/or salts. A correction factor is used to calculate the amount of compound necessary to achieve the desired concentration of the parent compound in solution.
- Purity of isomeric compounds is reported as the sum of the isomers.
- Purity values are rounded to the nearest whole number.

Certified Uncertainty Value Notes:

- The uncertainties are determined in accordance with ISO 17034 and Guide 35. The certified combined stressed uncertainty value (includes gravimetric uncertainty, homogeneity between-ampul uncertainty, storage stability uncertainty and shipping stability uncertainty and were combined using the following formula:

$$U_{combined\ stressed} = k \sqrt{U_{gravimetric}^2 + U_{homogeneity}^2 + U_{storage\ stability}^2 + U_{shipping\ stability}^2}$$

k is a coverage factor of 2, which gives a level of confidence of approximately 95%.

- It is important to note that the shipping stability uncertainty was obtained under temperature extremes for specific time intervals; therefore, the certified combined stressed uncertainty value should only be applied to the product if it was stored at non-standard temperature conditions up to and including 7 days. Contact Restek Technical Service at www.restek.com/Contact-Us for use recommendations if your shipment was in-transit for more than 7 days at non-standard temperature conditions.
- Apply the certified combined unstressed uncertainty value if the product was received under standard shipping conditions. Apply the certified combined stressed uncertainty value if the product was received under non-standard conditions as specified below.

Label Conditions	Standard Conditions	Non-Standard Conditions
25°C Nominal (Room Temperature)	< 60°C	≥ 60°C up to 7 days
10°C or colder (Refrigerate)	< 40°C	≥ 40°C up to 7 days
0°C or colder (Freezer)	< 25°C	≥ 25°C up to 7 days

- Separate (not combined) uncertainty values for gravimetric uncertainty are also displayed on the certificate, if needed, separate homogeneity between-ampul uncertainty, storage stability uncertainty and shipping stability uncertainty values are available by contacting Restek Technical Service at www.restek.com/Contact-Us.
- The packaged amount is the minimum sample size for which uncertainty is valid. The ampules are over-filled to ensure that the minimum packaged amount can be sufficiently transferred.

Manufacturing Notes:

- Concentration is based upon gravimetric preparation using either a balance whose calibration has been verified daily using NIST traceable weights, and/or dilutions with Class A glassware.

Handling Notes:

- Stability of the unopened product, when stored in compliance with the recommended conditions, is guaranteed through the expiration displayed on the product label and certificate. Contact Restek for additional opened product stability information, with the knowledge/understanding that open product stability is subject to the specific handling and environmental conditions to which the product is exposed. For your convenience Restek supplies deactivated vials with most standards packed in 2mL ampules. Larger volume deactivated vials are available through Restek as a custom ordered item. Additionally, Restek sells DMDCS for the purpose of glassware deactivation as catalog number 31861, which includes complete instructions.
- If any undissolved material is visible inside the ampul, sonicate the unopened ampul until the material is completely dissolved.

Certificate of Analysis

Octachlorodibenzofuran-¹³C₁₂

Catalog Number: EF-983
Solution Lot: ER080812-01
Expiration Date: August 2022
Solvent: n-Nonane
Volume per Ampule: Not less than 1.2 mL
Storage: Store at room temperature. Do not store cold.
Intended Use: For R&D/analytical purposes only. Not suitable for human or animal consumption.
Safety: Danger. See Safety Data Sheet.

- Expiration Date has been established through real time stability studies.
- Ampules are overfilled to ensure a minimum 1.2 mL volume fill. We advise laboratories to use measured volumes of this standard solution before diluting to the desired concentration.

Component	Solution Purity	Certified Concentration
Octachlorodibenzofuran- ¹³ C ₁₂	> 99.9%	50.00 ± 0.31 µg/mL
- Uncertainty of the concentration is expressed as an expanded uncertainty in accordance with ISO 17025 and Guide 34 at the approximate 95% confidence interval using a coverage factor of k = 2 and has been calculated by statistical analysis of our production system and incorporates uncertainty of the purity factor, material density, and balance and weighing technique. - This standard is prepared gravimetrically and mass results are reported on the conventional basis for weighing in air. Concentration is calculated based on: the actual measured mass; Purity Factor of the analyte(s); measured mass of the solution; and the density of the pure diluent at 20°C. - Concentration is corrected for chromatographic purity, residual water, residual solvents and residual inorganics.		

Solution Standard Verification and Homogeneity

Standard Solution	Lot Number	Verified Concentration (µg/mL)		%RSD - Homogeneity	
		Actual Results	Acceptance Criteria	Actual Results	Acceptance Criteria
New Lot	ER080812-01	51.3	± 5%	0.2	≤ 3%
Previous Lot	ER062011-01	47.2	-----	0.7	≤ 3%
- Concentration is verified through multiple analyses and is calculated as the average of multiple analyses compared to an independently prepared calibration solution. - Homogeneity of the New Lot is ensured through rigorous production process controls statistically analyzed to evaluate risk and verified by analysis. The % RSD of samples pulled from across the lot demonstrate homogeneity of the New Lot. - The % RSD of the Previous Lot represents variability of the analysis performed at the time of release.					

Traceability

- Gravimetrically prepared using qualified balances calibrated semi-annually by Mettler Toledo using NIST traceable weights. Calibration verification performed weekly and prior to each use utilizing NIST traceable weights. Each balance has been assigned a minimum weighing by Mettler Toledo taking into consideration the balance and installed environmental conditions to ensure weighing complies with USP tolerances of no more than 0.1% relative error.
- Concentration is verified against an independently prepared 4-point calibration curve gravimetrically prepared using balances calibrated to NIST.
- In addition, each neat material utilized has been identified and thoroughly characterized through the use of multiple analytical techniques. Spectral data is provided on subsequent pages of the COA.

Cerilliant certifies that this standard meets the specifications stated in this certificate and warrants this product to meet the stated acceptance criteria through the expiration/retest date when stored unopened as recommended. Product should be used shortly after opening to avoid concentration changes due to evaporation. Warranty does not apply to ampoules stored after opening.

Certificate of Analysis

2,3,7,8-Tetrachlorodibenzo-p-dioxin-³⁷Cl₄

Catalog Number: ED-907
Solution Lot: ER05211501
Expiration Date: July 2025
Solvent: n-Nonane
Volume per Ampule: Not less than 1.2 mL
Storage: Store at room temperature. Do not store cold.
Shipping: Ambient.
Intended Use: For R&D/analytical purposes only. Not suitable for human or animal consumption.
Instructions for Use: Sonicate before use.
Safety: **Danger. See Safety Data Sheet.**

- Expiration Date has been established through real time stability studies.
- Ampules are overfilled to ensure a minimum 1.2 mL volume. We advise laboratories to quantitatively transfer desired volumes of this standard using established good laboratory practices to dilute to the desired concentration.
- For MS Applications, we advise laboratories not to mix lots during a single sequence.

Component	Solution Purity	Certified Concentration
2,3,7,8-Tetrachlorodibenzo-p-dioxin- ³⁷ Cl ₄	98.5%	50.00 ± 0.23 µg/mL
• Uncertainty of the concentration is expressed as an expanded uncertainty in accordance with ISO 17025 and Guide 34 at the approximate 95% confidence interval using a coverage factor of k = 2 and has been calculated by statistical analysis of our production system and incorporates uncertainty of the purity factor, material density, and balance and weighing technique. • This standard is prepared gravimetrically and mass results are reported on the conventional basis for weighing in air. Concentration is calculated based on: the actual measured mass; Purity Factor of the analyte(s); measured mass of the solution; and the density of the pure diluent at 20 °C. • Concentration is corrected for chromatographic purity, residual water, residual solvents and residual inorganics.

Calibration verification performed weekly and prior to each use utilizing NIST traceable weights. Each balance has been assigned a minimum weighing by Mettler Toledo taking into consideration the balance and installed environmental conditions to ensure weighing complies with USP tolerances of no more than 0.1% relative error.
- Concentration is verified against an independently prepared 4-point calibration curve gravimetrically prepared using balances calibrated to NIST.
- In addition, each neat material utilized has been identified and thoroughly characterized through the use of multiple analytical techniques. Spectral data is provided on subsequent pages of the COA.

Cerilliant certifies that this standard meets the specifications stated in this certificate and warrants this product to meet the stated acceptance criteria through the expiration/retest date when stored unopened as recommended. Product should be used shortly after opening to avoid concentration changes due to evaporation. Warranty does not apply to ampoules stored after opening.

Labeled Compound Stock Solution

Catalog Number: EDF-8999
Solution Lot: ER05281501
Expiration Date: September 2025
Solvent: n-Nonane
Volume per Ampule: Not less than 500 μ L
Storage: Store at room temperature. Do not store cold.
Intended Use: **Sonicate before use.** For R&D/ analytical purposes only. Not suitable for human or animal consumption.
Safety: **Danger. See Safety Data Sheet.**

- * Expiration Date has been established through real time stability studies.
- * Ampules are overfilled to ensure a minimum 500 μ L volume. We advise laboratories to use measured volumes of this standard solution before diluting to the desired concentration.

Component	Lot Number	CAS Number	Chemical Formula	Molecular Weight	Chromatographic Purity	Concentration

Calibration and Verification Solutions
plus
Supplemental Calibration Solutions
EPA-1613CSL & EPA-1613CS0.5

DESCRIPTION:

EPA-1613CVS is a series of 5 HRGC/HRMS calibration solutions containing native and mass-labelled chlorinated dibenzo-p-dioxin (PCDD) and dibenzofuran (PCDF) congeners in nonane.

PRODUCT CODES

EPA-1613CVS
EPA-1613CS1
EPA-1613CS2
EPA-1613CS3
EPA-1613CS4
EPA-1613CS5

DATE PREPARED: (mm/dd/yyyy)

12/07/2007

LAST TESTED: (mm/dd/yyyy)

12/07/2007 (HRGC/HRMS)

EXPIRY DATE:

12/07/2014

DETAILS:

These solutions contain native ($^{12}\text{C}_{12}$) and mass-labelled ($^{13}\text{C}_{12}$ and $^{37}\text{Cl}_4$) PCDDs and PCDFs in the concentrations given in Table A in nonane. They are designed to be used as received.

According to U.S. EPA Method 1613, these solutions (CS1-CS5) are used to calibrate the HRGC/HRMS system prior to performing analyses on cleaned-up sample extracts. In addition, solution CS3 is used to verify the original calibration and CS1 is used to establish the required sensitivity of the HRGC/HRMS.

EPA-1613CSL and EPA-1613CS0.5 are lower level extensions to EPA-1613CVS. Neither is required by the method but either or both can be used to extend the calibration to lower levels.

EPA-1613CVS with EPA-1613CSL and EPA-1613CS0.5 were tested by HRGC/HRMS and found to give a linear calibration. The 5-point calibration summary for EPA-1613CVS is given in Table B and the 7-point calibration summary including both EPA-1613CSL and EPA-1613CS0.5 is shown in Table C. HRGC/HRMS data acquired for EPA-1613CS3, is shown in Figure 1.

ADDITIONAL INFORMATION:

For additional information including potential hazards, handling/storage, accuracy, and shelf life please request a copy of our Reference and Handling Guide. For your convenience this can be downloaded from our website at www.well-labs.com.

Certificate of Analysis

Octachlorodibenzofuran-¹³C₁₂

Catalog Number: EF-983
Solution Lot: ER062011-01
Expiration Date: June 2021
Solvent: n-Nonane
Volume per Ampule: Not less than 1.2 mL
Storage: Store at room temperature. Do not store cold.
Intended Use: For R&D/analytical purposes only. Not suitable for human or animal consumption.
Safety: Flammable

- Expiration Date has been established through real time stability studies.
- Ampules are overfilled to ensure a minimum 1.2 mL volume fill. We advise laboratories to use measured volumes of this standard solution before diluting to the desired concentration.

Component	Solution Purity	Certified Concentration
Octachlorodibenzofuran- ¹³ C ₁₂	99.4%	49.88 ± 0.31 µg/mL
• Uncertainty of the concentration is expressed as an expanded uncertainty in accordance with ISO 17025 and Guide 34 at the approximate 95% confidence interval using a coverage factor of k = 2 and has been calculated by statistical analysis of our production system and incorporates uncertainty of the purity factor, material density, and balance and weighing technique. • This standard is prepared gravimetrically and mass results are reported on the conventional basis for weighing in air. Concentration is calculated based on: the actual measured mass; Purity Factor of the analyte(s); measured mass of the solution; and the density of the pure diluent at 20°C. • Concentration is corrected for chromatographic purity, residual water, residual solvents and residual inorganics.		

Solution Standard Verification and Homogeneity

Standard Solution	Lot Number	Verified Concentration (µg/mL)		%RSD - Homogeneity	
		Actual Results	Acceptance Criteria	Actual Results	Acceptance Criteria
New Lot	ER062011-01	47.3	± 5%	0.7	≤ 3%
Previous Lot	ER121410-01	50.5	± 5%	0.8	≤ 3%
• Concentration is verified through multiple analyses and is calculated as the average of multiple analyses compared to an independently prepared calibration solution. • Homogeneity of the New Lot is ensured through rigorous production process controls statistically analyzed to evaluate risk and verified by analysis. The % RSD of samples pulled from across the lot demonstrate homogeneity of the New Lot. • The % RSD of the Previous Lot represents variability of the analysis performed at the time of release					

Traceability

- Gravimetrically prepared using qualified balances calibrated semi-annually by Mettler Toledo using NIST traceable weights. Calibration verification performed weekly and prior to each use utilizing NIST traceable weights. Each balance has been assigned a minimum weighing by Mettler Toledo taking into consideration the balance and installed environmental conditions to ensure weighing complies with USP tolerances of no more than 0.1% relative error.
- Concentration is verified against an independently prepared 4-point calibration curve gravimetrically prepared using balances calibrated to NIST.
- In addition, each neat material utilized has been identified and thoroughly characterized through the use of multiple analytical techniques. Spectral data is provided on subsequent pages of the COA.

Cerilliant certifies that this standard meets the specifications stated in this certificate and warrants this product to meet the stated acceptance criteria through the expiration/retest date when stored unopened as recommended. Product should be used shortly after opening to avoid concentration changes due to evaporation. Warranty does not apply to ampoules stored after opening.

Certificate of Analysis

Method 1613 Daily Calibration with Window Definer and Isomer Specificity

Catalog Number: EDF-4141 *A-E (Svials)*
Solution Lot: ER011711-01
Expiration Date: January 2021
Solvent: n-Nonane
Volume per Ampule: Not less than 200 µL
Storage: Store at room temperature. Do not store cold.
Intended Use: For laboratory use only. Not suitable for human or animal consumption.
Safety: **Danger. See Safety Data Sheet.**

- Expiration Date has been established through real time stability studies.
- Ampules are overfilled to ensure a minimum 200 µL volume. We advise laboratories to use measured volumes of this standard solution before diluting to the desired concentration.

*Rec'd 8/10/16
W/S Barlow*

Cerilliant certifies that this standard meets the specifications stated in this certificate and warrants this product to meet the stated acceptance criteria through the expiration/retest date when stored unopened as recommended. Product should be used shortly after opening to avoid concentration changes due to evaporation. Warranty does not apply to ampoules stored after opening.

CERTIFICATE ARI.352

ISO 9001:2008
CERTIFICATE 3854

Method 1613 Daily Calibration with Window Definer and Isomer Specificity

Catalog Number: EDF-4141
Solution Lot: ER011711-01
Expiration Date: January 2021
Solvent: n-Nonane
Volume per Ampule: Not less than 200 μ L
Storage: Store at room temperature. Do not store cold.
Intended Use: For laboratory use only. Not suitable for human or animal consumption.
Safety: **Danger. See Safety Data Sheet.**

- Expiration Date has been established through real time stability studies.
- Ampules are overfilled to ensure a minimum 200 μ L volume. We advise laboratories to use measured volumes of this standard solution before diluting to the desired concentration.

Cerilliant certifies that this standard meets the specifications stated in this certificate and warrants this product to meet the stated acceptance criteria through the expiration/retest date when stored unopened as recommended. Product should be used shortly after opening to avoid concentration changes due to evaporation. Warranty does not apply to ampoules stored after opening.

Darron Ellsworth, Quality Assurance Manager

COA Revision History

Revision No.	Date	Reason for Revision
00	February 28, 2011	Initial version
01	November 04, 2015	Updated Safety information.
02	February 25, 2016	Updated Volume from 0.2 mL to 200 μ L.
		Added uncertainty to all concentrations. Added statement regarding uncertainty.

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name : Method 1613 Calibration with Window Definer and Isomer Specificity Solution in n-Nonane

Product Number : EDF-4141
Brand : Cerilliant

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses : Laboratory chemicals, Synthesis of substances

1.3 Details of the supplier of the safety data sheet

Company : Sigma-Aldrich
3050 Spruce Street
SAINT LOUIS MO 63103
USA

Telephone : +1 800-325-5832
Fax : +1 800-325-5052

1.4 Emergency telephone number

Emergency Phone # : (314) 776-6555

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)

Flammable liquids (Category 3), H226

Skin irritation (Category 2), H315

Specific target organ toxicity - single exposure (Category 3), Central nervous system, H336

Aspiration hazard (Category 1), H304

Acute aquatic toxicity (Category 1), H400

Chronic aquatic toxicity (Category 1), H410

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word

Danger

Hazard statement(s)

H226

H304

H315

Flammable liquid and vapour.

May be fatal if swallowed and enters airways.

Causes skin irritation.

	Muta. 2; STOT SE 3; Aquatic Acute 1; Aquatic Chronic 1; H301, H319, H335, H341, H410	
1,2,3,7,8,9-Hexachlorodibenzofuran		
	Acute Tox. 3; Eye Irrit. 2A; Muta. 2; STOT SE 3; Aquatic Acute 1; Aquatic Chronic 1; H301, H319, H335, H341, H410	< 0.1 %
1,2,3,7,8-Pentachloro-dibenzofuran		
	Acute Tox. 3; Eye Irrit. 2A; Muta. 2; STOT SE 3; Aquatic Acute 1; Aquatic Chronic 1; H301, H319, H335, H341, H410	< 0.1 %
2,3,4,7,8-Pentachloro-dibenzofuran		
	Acute Tox. 1; Eye Irrit. 2A; Carc. 1A; STOT SE 3; STOT RE 2; Aquatic Acute 1; Aquatic Chronic 1; H300, H319, H335, H350, H373, H410	< 0.1 %

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice

Consult a physician. Show this safety data sheet to the doctor in attendance. Move out of dangerous area.

If inhaled

If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact

Wash off with soap and plenty of water. Consult a physician.

In case of eye contact

Flush eyes with water as a precaution.

If swallowed

Do NOT induce vomiting. Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed

The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed

No data available

		TWA	200 ppm 1,050 mg/m3	USA. NIOSH Recommended Exposure Limits
		TWA	200 ppm 1,050 mg/m3	USA. OSHA - TABLE Z-1 Limits for Air Contaminants - 1910.1000
		Potential Occupational Carcinogen Formed during past production of 2,4,5-trichlorophenol, 2,4,5-T & 2(2,4,5-trichlorophenoxy)propionic acid. See Appendix A		

Hazardous components without workplace control parameters

8.2 Exposure controls

Appropriate engineering controls

Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

Personal protective equipment

Eye/face protection

Face shield and safety glasses Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection

Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Body Protection

Complete suit protecting against chemicals, Flame retardant antistatic protective clothing., The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection

Where risk assessment shows air-purifying respirators are appropriate use a full-face respirator with multi-purpose combination (US) or type ABEK (EN 14387) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure

Prevent further leakage or spillage if safe to do so. Do not let product enter drains. Discharge into the environment must be avoided.

- 10.4 Conditions to avoid**
Heat, flames and sparks.
- 10.5 Incompatible materials**
Strong oxidizing agents
- 10.6 Hazardous decomposition products**
Other decomposition products - No data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity

No data available

Inhalation: No data available

Dermal: No data available

No data available

Skin corrosion/irritation

No data available

Serious eye damage/eye irritation

No data available

Respiratory or skin sensitisation

No data available

Germ cell mutagenicity

No data available

Carcinogenicity

IARC: No component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

NTP: No component of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

OSHA: No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity

No data available

No data available

Specific target organ toxicity - single exposure

No data available

Specific target organ toxicity - repeated exposure

No data available

Aspiration hazard

No data available

Additional Information

RTECS: Not available

To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

Data File: \\chromna\Denver\ChromData\VMS_MS1\20190108-77845.b\MS1_1082.D

Injection Date: 08-Jan-2019 14:14:30

Instrument ID: VMS_MS1

Operator ID: wickhamt

Lims ID: std

Worklist Smp#: 25

Client ID:

Purge Vol: 20.000 mL

Dil. Factor: 1.0000

ALS Bottle#: 17

Method: AQ_VMS1_8260

Limit Group: MSV - 8260B Water and Solid

Column: DB-624 (60.25) (0.25 mm)

Y Scaling: Method Defined: Scale to the Nth Largest Target: 1

Batch Notes	

Basis	Basis Description
T	Total/NA

The pound sign (#) in the amount added field denotes that the reagent was used undiluted. All calculations are performed using the stated concentration for this reagent.

Method 8270D

Semivolatile Organic Compounds
(GC/MS) by Method 8270D

Review Items	N/A	Yes	No	If No, why is data reportable?	2nd Level
1. Was the mass resolution documented before beginning the initial calibration?		✓			/
2. Was the instrument resolution >10,000 (<100 ppm) on PFK m/z 304.9824 and m/z 380.9760 (MAT) and > 10,000 on FC43 m/z 313.9838, 351.9802 and 363.9807? FC43 m/z 313.9838, 351.9802 and 375.9802? FC43 m/z 375.9802, 401.9770 and 413.9770? FC43 m/z 413.9775, 425.9770 and 463.9738? FC43 m/z 425.9775, 463.9743 and 501.9706? (DFS)		✓			/
3. Was the measured exact mass of m/z 380.9760 (PFK) or m/z 363.9807 (FC43) within 5 ppm at reduced accelerating voltage?		✓			/
4. Was the Window Defining Mixture analyzed and the MID switchpoints set to encompass the retention time windows of each congener group?		✓			/
5. Was the Column Performance solution analyzed and the %Valley ≤25 for separation between 2378-TCDD/F and the closest eluting non-2378 isomer on their respective columns?		✓			/
6. Were the five calibration standard solutions, at the concentrations specified in Table 5 of the SOP, analyzed (6 point calibration used for microwave extractions)?		✓			/
7. Was date/time of analysis verified between analysis header and logbook as correct?		✓			/
8. Were the response factors calculated for each labeled standard and unlabeled native analyte using the SOP specified reference compound (Table 3), quantitation ions (Table 21) and formula (Section 10.2.7)?		✓			/
9. Is the retention time of ¹³ C ₁₂ -1,2,3,4-TCDD >25.0 minutes on the DB/Rtx-5 column (15.0 minutes on the DB/Rtx-225 column)?		✓			/
10. Are the relative retention times of all PCDDs/PCDFs and all labeled compounds within the limits specified in Table 3?		✓			/
11. Are %RSD ≤20% for all unlabeled native analytes except 1,2,3,7,8,9-HxCDD and OCDF?		✓			/
12. Are %RSD ≤35% for 1,2,3,7,8,9-HxCDD and OCDF and all labeled internal standards?		✓			/
13. Are all S/N ratios ≥10 for the GC signals in each EICP (extracted ion chromatographic profile) including internal standards?		✓			/
14. Are the ion abundance ratios for all labeled and unlabeled analytes within the control limits specified in Table 22 of the SOP?		✓			/
15. Was the second source ICV standard analyzed according to Sec 10.2.9 of the SOP?		✓			/
16. If manual integrations were performed, are they clearly identified, initialed and dated?	✓				/
17. Were before/after chromatograms reviewed to determine whether the software and manual integrations were appropriate?		✓			/
18. Were manual integrations documented properly?	✓				/
19. If criteria were not met, was a NCM generated, approved by supervisor, and copy included in folder?	✓				/
20. Does the ICAL folder contain complete data in the following order: Data review checklist, a complete run log, Avg. %RSD summary, Ratio summary, Calculation summary, PFK/FC43 resolution/peak match documentation; Total RIC, EICP's and manual integration - for window and all standards, in order from low to high standard, ICV Summary Table, Calculation Summary, and chromatograms?		✓			/

Review Items	N/A	Yes	No	If No, why is data reportable?	2nd ✓
1. Was the mass resolution documented at both the beginning and end of the 12 hour shift and is data verified as within the 12 hour clock? Was the continuing calibration performed at the beginning of the shift (all methods) and ending of the shift (8290/8290A)?		✓			✓
2. Was the Instrument resolution >10,000 (<100 ppm) on either PFK or FC43 for the masses listed in SOP section 10.2.3?		✓			✓
3. Was the measured exact mass within 5 ppm at reduced accelerating voltage for masses listed in the SOP section 10.2.4?		✓			✓
4. Was the Window Defining Mixture analyzed and the MID switchpoints set to encompass the retention time windows of each congener group?		✓			✓
5. Was the Column Performance solution analyzed and the %Valley ≤25 for separation between 2378-TCDD/F and the closest eluting non-2378 isomer on their respective columns?		✓			✓
6. Was DoD Performance check criteria met?		✓			✓
7. Were the response factors calculated for each labeled standard and unlabeled native analyte using the SOP specified reference compound (Table 3), quantitation ions (Table 21), and formula (Section 10.2.7)?		✓			✓
8. Are the measured RRFs and/or concentrations for each compound within the specified control limits in Table 7 for all PCDDs/PCDFs?		✓		☐ CCV-Capping, RR Confirms (NCM# _____) ☐ CCV-Capping-Detects (8290/8290A) (NCM# _____) ☐ CCV-Capping-IDA (8290/8290A) (NCM# _____)	✓
9. Are the relative retention times of all PCDDs/PCDFs and all labeled compounds within the limits specified in Table 3 (1613B)?		✓			✓
10. Is the retention time of C ¹³ -1,2,3,4-TCDD >25 minutes on the Rtx-5 column and/or >15.0 min on the DB-225?		✓			✓
11. Are all S/N ratios ≥10 for the GC signals in each EICP (extracted ion chromatographic profile) including IDA's?		✓			✓
12. Are the ion abundance ratios for all labeled and unlabeled analytes within the control limits specified in Table 22 of the SOP?		✓			✓
13. Were all reagents used for calibration verified as correct in the reagent tab?		✓			✓
14. If manual integrations were performed, are the analyst name, reason, and date noted in the AD II batches? Are before and after graphics uploaded to AD II?		✓			✓
15. Were all graphics checked after upload to AD II? Was the mass res check scanned and attached to the corresponding CCV?		✓			✓
16. If criteria were not met, was a NCM generated?	✓				✓
17. Do the AD II batches contain a completed checklist for this work list?		✓			✓

 ADII Batch #(s): 27191, 27192, 27193
 Job #(s): See Comments

Review Items	N/A	Yes	No	Why is data reportable?	2nd ✓
1. Was the correct ICAL used for quantitation? (Check ICAL event number in every sample and CCV.)		✓		ICAL Event # <u>825, 827, 828</u>	✓
2. Has a Continuing Calibration Checklist been completed for each work list?		✓			✓
3. Were all special project requirements met (checked in backlog report and in AD II under notes)?		✓			✓
4. DoD requirements met?		✓		☐ NCM#140-11724: Add to Case Narrative if Manual Integrations Performed ☐ Narrate reasons for multiple analyses of samples <u># 10-14 - complex Dilution</u> ☒ Dilution-Respike IDA. (NCM# <u>140-16151</u>)	✓
5. Were the prep factors and dilution factors verified in AD II?		✓			✓
6. Is date/time of analysis correct and within the 12 hour clock?		✓			✓
7. Sample analyses done within preparation and analytical HT? (Check for H-flag in sample result in AD II.)		✓		☐ Holding Time-Initial Analysis (NCM# _____) ☐ Holding Time-Reanalysis (NCM# _____)	✓
8. Are IDA ratios within limits specified in Table 22 of the SOP?			✓	☒ Abundance ratio outside limit (NCM# <u>140-16153</u>)	✓
9. Are IDAs and cleanup standards within QC limits specified in Table 13?		✓		☐ IDA-Low-S/N 10:1 (NCM# _____) ☐ IDA-High-Isotope Dilution (NCM# _____)	✓
10. Were reported PCDD/Fs which did not meet the criteria below properly calculated and reported as EMPCs? • RT of 2378 isomers within SOP Table 3 limits. • RT of non-2378 isomers within established first/last windows. • Both native ions maximized within ±2 seconds. • Ion abundance ratios within the control limits specified in Table 22 (not adjusted for 8290A). • No corresponding peak at PCDFE mass (dpe tab checked and flag added in peak review). • Ion suppression tab checked and flags added in peak review if needed. • Co-elution (CI) flags added manually in AD II if needed.		✓		<u>#19, #21</u> ←	✓
11. Were all 2378-TCDF hits greater than or equal to the ML turned to acceptable on the primary column and confirmed on the DB-225 confirmation column?		✓		Were all of the samples marked as acceptable for TCDF analyzed on a DB-225 column and the lower result reported?	✓
12. Are non-detects that are G-qualified narrated?		✓		☒ (NCM# <u>140-16152</u>)	✓
13. Are positive results > ML within calibration range?		✓		☐ ICAL-Range Exceed; No Sat. (NCM# _____) ☐ non-2378's or OCDD/F (NCM# _____)	✓
14. Are all manual integrations documented with analyst name, reason, and date noted in AD II?		✓			✓
15. Were all graphics uploaded into AD II?		✓			✓
16. Final report acceptable (1. Job Data Review was checked and all CCVs, QC, and samples are turned to 2nd Level, 2. The narrative was checked in Supervisor Desktop for all deviations and grammar errors, and 3. All QC links were verified and at least one sample from every job is linked to the ICAL)?		✓			✓
17. LCS/LCSD done per prep batch and all analytes within limits?		✓		☐ LCS/LCSD-Insuff. Sample (NCM# _____) ☐ LCS/LCSD-%R High (NCM# _____)	✓
18. Method blank done per prep batch, method/instrument blank analyzed with each sequence and analytes present in the method blank < ML or within specific program requirements?		✓		☐ Method Blank-Report, 10X (NCM# _____) ☐ Method Blank-Report, ND (NCM# _____) ☐ Method Blank-Insuff. Sample (NCM# _____)	✓

TestAmerica Knoxville Dioxin GC/MS Continuing Calibration Review / Narrative Checklist

Method: ~~X~~8290 ~~X~~8290A ~~X~~1613B - KNOX-ID-0004-R19

Start Mass Res. ✓:	09:38	Start Ver Filename:	d319012982	Inst/Date:	D2A / 1-29-19
End Mass Res. ✓:	21:25	Win/CPS Filename:	L	ICAL Event #s):	827, 825
WL#:	10667	End Ver Filename:	d319012983	Job # (s):	See below
AD Batch #s):	27241, 27242	PMP 1-29-19			

Review Items	N/A	Yes	No	If No, why is data reportable?	2nd ✓
1. Was the mass resolution documented at both the beginning and end of the 12 hour shift and is data verified as within the 12 hour clock? Was the continuing calibration performed at the beginning of the shift (all methods) and ending of the shift (8290/8290A)?		✓			✓
2. Was the instrument resolution >10,000 (<100 ppm) on either PFK or FC43 for the masses listed in SOP section 10.2.3?		✓			✓
3. Was the measured exact mass within 5 ppm at reduced accelerating voltage for masses listed in the SOP section 10.2.4?		✓			✓
4. Was the Window Defining Mixture analyzed and the MID switchpoints set to encompass the retention time windows of each congener group?		✓			✓
5. Was the Column Performance solution analyzed and the %Valley ≤25 for separation between 2378-TCDD/F and the closest eluting non-2378 isomer on their respective columns?		✓			✓
6. Was DoD Performance check criteria met?	✓				✓
7. Were the response factors calculated for each labeled standard and unlabeled native analyte using the SOP specified reference compound (Table 3), quantitation ions (Table 21), and formula (Section 10.2.7)?		✓			✓
8. Are the measured RRFs and/or concentrations for each compound within the specified control limits in Table 7 for all PCDDs/PCDFs?		✓		☐ CCV-Capping, RR Confirms (NCM# _____) ☐ CCV-Capping-Detects (8290/8290A) (NCM# _____) ☐ CCV-Capping-IDA (8290/8290A) (NCM# _____)	✓
9. Are the relative retention times of all PCDDs/PCDFs and all labeled compounds within the limits specified in Table 3 (1613B)?		✓			✓
10. Is the retention time of C ¹³ -1,2,3,4-TCDD >25 minutes on the Rtx-5 column and/or >15.0 min on the DB-225?		✓			✓
11. Are all S/N ratios ≥10 for the GC signals in each EICP (extracted ion chromatographic profile) including IDA's?		✓			✓
12. Are the ion abundance ratios for all labeled and unlabeled analytes within the control limits specified in Table 22 of the SOP?		✓			✓
13. Were all reagents used for calibration verified as correct in the reagent tab?		✓			✓
14. If manual integrations were performed, are the analyst name, reason, and date noted in the AD II batches? Are before and after graphics uploaded to AD II?	✓				✓
15. Were all graphics checked after upload to AD II? Was the mass res check scanned and attached to the corresponding CCV?		✓			✓
16. If criteria were not met, was a NCM generated?	✓				✓
17. Do the AD II batches contain a completed checklist for this work list?		✓			✓

Lab Sample ID	Note in TALS if visible solids are present. (≤1%, >1%)	Note in TALS if sample is filtered. Soxhlet	Add sample to sep funnel.	Add 1.0/2.0 ng/mL IS (IDA) to all samples & QC. Record in TALS.	Add 0.2/1.0/2.0 ng/mL native spike (TA) to LCS, MS, MSD. Record in TALS.	Perform sep funnel extraction with methylene chloride.	Concentrate sep funnel extract.	Solvent exchange to appropriate volume of hexane.	Conc filter extract. Add 100 µL tetradecane to 40 mL vial.	Exchange filter extract to appropriate volume of hexane. Combine filter extract and sep funnel extract.	Add 0.2 ng/mL cleanup std (SU) to all 1613B extracts. Record in TALS.	Acid/Base wash extracts if needed.	Concentrate to ~2 to 4 mL on N-EVAP for dual column cleanup.	Perform silica gel/alumina column cleanup.	Concentrate to ~2 mL on N-EVAP for carbon cleanup.	Perform carbon cleanup. Add 100 µL nonane to 40 mL vial.	Concentrate to 50 µL on N-EVAP. Adjust volume to 5 mL MeCl ₂ .	Perform GPC cleanup.	Concentrate/solvent exchange to hexane to appropriate volume.	Concentrate to <1 mL.	Add 100 ng/mL recovery std (IS) to mini-vial. Record in TALS. Transfer extract to	Conc to final volume in nonane. Record final volume in TALS.

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST

Review Items	Yes	No	NA	If No, what was the problem?	Comments/Actions Taken
1. Are the shipping containers intact?	/			☐ Containers, Broken	
2. Were ambient air containers received intact?			/	☐ Checked in lab	
3. The coolers/containers custody seal if present, is it intact?	/			☐ Yes ☐ NA	
4. Is the cooler temperature within limits? (> freezing temp. of water to 6°C, VOST: 10°C) Thermometer ID: <u>5668</u> Correction factor: <u>±0.0</u>	/			☐ Cooler Out of Temp, Client Contacted, Proceed/Cancel ☐ Cooler Out of Temp, Same Day Receipt	
5. Were all of the sample containers received intact?	/			☐ Containers, Broken	
6. Were samples received in appropriate containers?	/			☐ Containers, Improper; Client Contacted; Proceed/Cancel	
7. Do sample container labels match COC? (IDs, Dates, Times)	/			☐ COC & Samples Do Not Match ☐ COC Incorrect/Incomplete ☐ COC Not Received	
8. Were all of the samples listed on the COC received?	/			☐ Sample Received, Not on COC ☐ Sample on COC, Not Received	
9. Is the date/time of sample collection noted?	/			☐ COC; No Date/Time; Client Contacted	
10. Was the sampler identified on the COC?	/		/	☐ Sampler Not Listed on COC	
11. Is the client and project name/# identified?	/			☐ COC Incorrect/Incomplete	
12. Are tests/parameters listed for each sample?	/			☐ COC No tests on COC	
13. Is the matrix of the samples noted?	/			☐ COC Incorrect/Incomplete	
14. Was COC relinquished? (Signed/Dated/Timed)	/			☐ COC Incorrect/Incomplete	
15. Were samples received within holding time?	/			☐ Holding Time - Receipt	
16. Were samples received with correct chemical preservative (excluding Encore)?			/	☐ pH Adjusted, pH Included (See box 16A) ☐ Incorrect Preservative	
17. Were VOA samples received without headspace?			/	☐ Headspace (VOA only)	
18. Did you check for residual chlorine, if necessary? (e.g. 1613B, 1668) Chlorine test strip lot number: <u>794 2020/04</u>	/			☐ Residual Chlorine	
19. For 1613B water samples is pH<9?	/			☐ If no, notify lab to adjust	
20. For rad samples was sample activity info. Provided?			/	☐ Project missing info

Appendix J
Hydrogeologic Assessment Report

January 14, 2019

Ms. Abby Mazza
City of Chicago
Department of Fleet and Facility Management
30 North LaSalle, Suite 300
Chicago, Illinois 60606

**Subject: Hydrogeologic Assessment
Former Carnotite Reduction Company Site
434 East 26th Street
Chicago, Illinois**

Dear Ms. Mazza:

Tetra Tech, Inc. (Tetra Tech) performed a hydrogeologic assessment at the former Carnotite site in December 2018. The assessment was performed as part of the pre-design investigation to support the remedial design. The following includes a summary of work performed and conclusions regarding the hydrogeology at the site.

Hydraulic Conductivity: Tetra Tech collected hydraulic conductivity data to assess the flow rates necessary to dewater the excavation area and to maintain control of any seepage. Slug testing was performed for calculation of the groundwater flow rate, which will be used to determine the numbers and capacity of pumps needed to control the groundwater flow into the excavation. This information will also determine the capacity of treatment equipment needed for pre-treatment of the groundwater prior to discharge to the Metropolitan Water Reclamation District of Greater Chicago.

On December 12, 2018, Tetra Tech performed rising-head (slug out) tests in three groundwater monitoring wells at the site (ASC-2A, ASC-5, and MW-1) to determine the hydraulic conductivity (k) at the site and evaluate the potential groundwater extraction and discharge rates at the site.

The rising-head slug test involves withdrawing a known volume of water from a well and monitoring the resulting change in water level over time. The slug used for the tests was a disposable bailer that was 3 feet long and 1.75 inches in outer diameter; therefore, the volume of water expected to be removed was approximately 0.375 gallon.

The three monitoring wells tested have 10-foot-long screens that cross the water table. The rising-head tests are most effective for wells screened across the water table (Butler 2014).

Before conducting the tests in each well, the pressure transducer was set approximately 1 foot above the bottom of the well and was set to record water level readings on a logarithmic scale. A slug was then instantaneously removed (time zero) and water level readings were automatically recorded during water level recovery. Another test was performed after the water level recovered to approximately 90 percent or more of the static level. Three slug tests were completed at each well and the water removed was containerized and stored onsite for treatment and disposal at a later date.

Tetra Tech Inc.

1 S. Wacker Drive, 37th Floor, Chicago, IL 60606
Tel 312-201-7700 Fax 312-938-0118 www.tetrattech.com

After the tests were completed, the pressure transducer data were saved and later imported into the Super Slug 3.1 software (Starpoint Software, Inc. 2008) for interpretation. The displacement-versus-time data for individual wells were interpreted using Bouwer and Rice methods (1976 and 1989). The Super Slug printouts containing the details of slug test interpretations and calculated average hydraulic conductivities are enclosed. The average calculated hydraulic conductivities for individual wells are listed below:

- ASC-2A – 4.59×10^{-3} centimeters per second (cm/sec)
- ASC-5 – 7.17×10^{-3} cm/sec
- MW-1 – 1.69×10^{-3} cm/sec

The overall average hydraulic conductivity determined from the assessment is 3.11×10^{-3} cm/sec.

Surveying: Prior to slug testing on December 12, 2018, the depth to water was obtained at groundwater monitoring wells ASC-2A, ASC-4, ASC-5, and MW-1. The depth to water ranged from 8.25 to 11.76 feet below ground surface. On December 20, 2018, these wells were surveyed by an Illinois-licensed professional surveyor for ground surface and top-of-casing elevations. The depth to water and survey data were used to determine groundwater elevations at the site and to establish the groundwater flow direction to the east-northeast. A groundwater flow map and survey and groundwater elevation data obtained are also enclosed.

Arithmetic Means:

Hydraulic Conductivity 1.511e-003 cm/sec
Transmissivity 7.958 meters²/day

Geometric Means:

Hydraulic Conductivity 1.374e-003 cm/sec
Transmissivity 7.238 meters²/day

Sensitivity Analysis:

Hydraulic Conductivity

1.886e-003 cm/sec

Transmissivity

9.933 meters²/day

Bouwer and Rice Automatic Parameter Estimation

Carnotite

Location: Chicago, IL
 Test Date: December 12, 2018
 Client: City of Chicago, 2FM
 Import File: C:\Users\Dave\Desktop\MW-1-3.txt

Well Label: MW-1 - Test 3
 Aquifer Thickness: 20. feet
 Screen Length: 10. feet
 Casing Radius: 1. Inches
 Effective Radius: 2.125 Inches
 Gravel Pack Porosity: 30. %
 Corrected Casing Radius: 1.433 Inches
 Bouwer and Rice Parameter A: 3.2
 Bouwer and Rice Parameter B: 0.6681
 Radius of Influence of Test: 2.681 feet

Appendix L

Health and Safety and Radiation Protection Plan

This Example HASP and RPP has been developed as an example and is for informational purposes only. The remediation contractor selected by the City of Chicago, Department of Assets, Information and Services will be required to develop and provide a copy of a separate site-specific HASP and RPP covering all activities included in the contractor's scope of work.

1.0 INTRODUCTION

This example health and safety and radiation protection plan (HASP/RPP) provides typical health and safety and radiation protection requirements for tasks conducted by the Engineer during remediation activities at the former Carnotite Reduction Company (Carnotite) Site (the site), in Chicago, Cook County, Illinois. This example HASP/RPP also clarifies the roles and responsibilities of the Engineer and remediation contractor. The City of Chicago Department of Assets, Information and Services (AIS) is conducting remediation of the Carnotite site. As AIS's representative, the Engineer will direct and oversee site remediation activities under the Illinois Environmental Management Agency (IEMA) radioactive facility license for the site. Soil excavation, transportation, and disposal and water management and treatment activities, as well as other construction-related site activities specified in the bid documents, will be conducted by a remediation contractor, which will be procured by AIS. This example HASP/RPP is focused on the assessment of the types, risk levels, and severity of hazards for the Engineer project tasks. However, prior to beginning on-site remediation activities, the Engineer must prepare a site-specific HASP/RPP, including relevant safe work practices (SWP), job/activity hazard analyses, standard operating procedures (SOP), documentation of employee training and qualifications, and relevant forms, such as daily tailgate safety meeting, daily site log, signature page indicating review and understanding of personnel involved, etc.. The remediation contractor will also be required to prepare a site-specific HASP/RPP for project tasks to be conducted by the remediation contractor and any associated subcontractors. If subcontractor tasks are not included in the remediation contractors HASP/RPP, the subcontractors must also submit site-specific HASPs or HASP/RPP(s), as appropriate, encompassing the subcontractor's specific onsite activities. All plans must be submitted for AIS and IEMA review prior to conducting on-site remediation activities.

The Engineer and the Engineer's Radiation Safety Officer (RSO) will complete several tasks in implementing the HASP/RPP and other associated plans, such as the field sampling plan (FSP) and quality assurance project plan (QAPP). These tasks include the following:

- Maintain compliance with the site's IEMA Radioactive Material License and all applicable regulations.
- Provide and document site-specific radiation safety training of key on-site personnel, including remediation contractor and their subcontractor personnel, prior to initiation of remediation activities.
- Oversee and document excavation work and progress.
- Conduct on-site soil radiation screening to guide soil excavation activities, facilitate segregation of clean material, and reduce volume of soil requiring off-site disposal.
- Direct soil blending activities based on soil concentrations, if necessary.

- Collect soil samples to document concentrations of radium-226 (Ra-226), total uranium, and thorium-230 (Th-230) in soil, not including waste characterization sampling necessary for waste profiling.
- Collect post-treatment system effluent water samples prior to discharge to the Metropolitan Water Reclamation District of Greater Chicago to verify compliance with applicable standards.
- Conduct work area respirable particulate dust monitoring.
- Conduct work area high-volume air sampling to evaluate potential occupational exposures to airborne radium, uranium, and thorium during excavation. Low-volume personal air sampling for worst-case individuals, as directed.
- Conduct site perimeter low-volume air sampling to monitor airborne effluents and evaluate potential airborne radium, uranium, and thorium exposures to the public. The perimeter air sampling procedures are discussed in detail in the FSP.
- Implement a site external dosimetry program and provide external dosimetry for Engineer staff and their subcontractor personnel.
- Conduct and supervise surveys of equipment and materials for release for unrestricted use. This includes advising remediation contractor on decontamination requirements and post-decontamination evaluation.
- Maintain site controls to prevent cross contamination and offsite releases of radiological contamination. This includes maintaining boundaries and the implementation of clean areas, contamination reduction zones, and exclusion zones.
- Conduct site access control surveys to eliminate potential cross contamination, such as work area surveys, clean area surveys, and contamination reduction zone surveys.
- Conduct and supervise surface contamination surveys of all personnel.
- Conduct wipe sampling of vehicles and equipment prior to demobilization from the site.
- Conduct work area gamma dose rate surveys.
- Conduct perimeter passive gamma radiation monitoring by use of dosimeters with optically stimulated luminescence (OSL) technology. The perimeter air monitoring procedures are discussed in detail in the FSP.
- Conduct perimeter passive radon monitoring. The perimeter air monitoring procedures are discussed in detail in the FSP.
- Collect verification soil samples.
- Collect construction debris and soil disposal criteria samples to identify appropriate non-radiological disposal options.
- Conduct the final status radiation surveys of remediated areas.
- Verification of analytical data generated by subcontracted laboratories

The remediation contractor shall designate their own RSO in addition to being responsible for implementing a site-specific HASP/RPP encompassing tasks for their personnel and subcontractors. The remediation contractor's RSO shall be responsible for the following tasks:

- Conduct work area air sampling to evaluate potential internal uranium, thorium, and radium exposures for remediation contractor's and subcontractor's personnel.
- Provide external dosimetry and any necessary personnel-related sampling or air monitoring for the remediation contractor's and subcontractor's personnel.
- Conduct surface contamination and exposure rate surveys of contaminated soil trucks leaving the site in order to comply with U.S. Department of Transportation regulations and waste disposal site acceptance criteria.
- Conduct decontamination of equipment and materials as necessary.
- Conduct surveys of equipment and materials prior to approval for release for unrestricted use by the Engineer's RSO.
- Conduct clean area radiological surveys in remediation contractor's support zone workspaces.
- Comply with all aspects of the site access control program.

This document addresses items specified under OSHA regulations at 29 CFR, Part 1910.120 (b), "Final Rule." The site-specific HASP/RPP will be available to all personnel who could be exposed to hazardous on-site conditions.

The purpose of this example HASP/RPP is to present typical Engineer health and safety and radiation protection requirements for site remediation activities and designate protocols to be followed during Engineer activities at the site. This example HASP/RPP also discusses the different task responsibilities for the Engineer's and remediation contractor's separate RSOs. All personnel on site, including the Engineer and their subcontractor employees and site visitors, must be informed of site emergency response procedures and any potential fire, explosion, health, or safety hazards associated with on-site activities. This example HASP/RPP summarizes potential hazards and specifies protective measures planned for Engineer site activities.

This plan must be reviewed and approved by the Engineer's Health and Safety Representative (HSR) or a designee, and the Engineer's Project Manager (PM) (see the Reviews and Approvals form after the cover page in this document). The Compliance Agreement form must be signed by all Engineer and associated subcontractor personnel before they enter the site. Protocols established in this HASP/RPP are based on available site data, on-site conditions, as well as health and safety hazards known or anticipated at the site. This plan is intended solely for use during proposed activities described in the corresponding site-specific work plan. Specifications in this HASP/RPP are subject to review and revision based on actual conditions encountered in the field during site activities. Significant revisions to this plan must be approved by the Engineer's PM and the Engineer's HSR.

2.0 HEALTH AND SAFETY PERSONNEL AND PLAN ENFORCEMENT

This section describes responsibilities of project personnel, summarizes requirements for subcontractors and visitors who want to enter the site, discusses different task responsibilities for the Engineer's and removal contractor's separate RSOs, and discusses HASP/RPP enforcement.

2.1 PROJECT PERSONNEL

The following personnel and organizations are associated with planned activities at the site. The organizational structure will be reviewed and updated as necessary during the course of the project.

Name/Title	Responsibility	Telephone No.
Client Representatives		
Abby Mazza	AIS PM	(312) 744-3161
Illinois Emergency Management Agency (IEMA) Representatives		
Kelly Horn	IEMA Lead PM	(217) 558-5135
Kelly Grahm	IEMA PM	(630) 293-8242
Radiation Safety Officer		
Engineer Personnel		
Engineer Subcontractor Personnel		

The Engineer's RSO, PM, Field Team Leader, Site Safety Coordinator (SSC), and HSR, as well as the RSO, will be responsible for implementation and enforcement of the provisions of this HASP/RPP. Their duties and expectations of the Engineer's employees are described in the following sections.

2.1.1 Radiation Safety Officer

The Engineer's RSO is responsible for ensuring that all work performed at the site complies with the conditions of the site's IEMA Radioactive Materials License and all applicable radiation safety regulations. The Engineer's RSO is responsible for continually evaluating site working conditions to ensure that all radiological exposures to both site personnel and individual members of the public are kept As Low as Reasonably Achievable (ALARA). The Engineer's RSO is also responsible for the promotion of a positive nuclear safety culture at the site, where a collective commitment by leaders and individuals emphasize safety over competing goals to ensure the protection of personnel, public, and the environment. Duties of the Engineer's RSO include the following:

- Providing and documenting site-specific radiation safety training to key on-site personnel, including remediation contractor and their subcontractor personnel, prior to initiation of remediation activities.
- Assisting the Engineer in overseeing excavation work.
- Conducting on-site soil radiation screening to guide soil excavation activities, facilitate segregation of clean material, and reduce volume of soil requiring off-site disposal.
- Implementing site air monitoring program to evaluate potential occupational exposures from airborne radiological particulates, including conducting work area high-volume air sampling for radium, uranium, and thorium during excavation. Additionally, conducting low-volume personal air sampling for individuals, as needed.
- Implementing the air monitoring program to also evaluate potential public exposures from airborne radiological particulates. Including conducting perimeter passive gamma radiation monitoring by use of dosimeters with optically stimulated luminescence (OSL) technology. Also, conducting perimeter passive radon monitoring. The perimeter air monitoring procedures are discussed in detail in the FSP.
- Conduct site perimeter low-volume air sampling to monitor airborne effluents and evaluate potential airborne radium, uranium, and thorium exposures to the public. The perimeter air sampling procedures are discussed in detail in the FSP.
- Implementing a site external dosimetry program and providing external dosimetry for Engineer staff and their subcontractor personnel.
- Maintaining site controls to prevent cross contamination and offsite releases of radiological contamination. This includes maintaining boundaries and the implementation of clean areas, contamination reduction zones, and exclusion zones.
- Conducting site access control surveys to eliminate potential cross contamination, such as work area surveys, clean area surveys, and contamination reduction zone surveys.
- Conducting and supervising surface contamination surveys of all personnel.
- Conducting and supervising surveys of equipment and materials for release for unrestricted use. This includes advising remediation contractor on decontamination requirements and post-decontamination evaluation.
- Conduct work area gamma dose rate surveys.
- Conducting the final status radiation surveys of remediated areas.
- Advise Field Team Leader and PM of site radiological hazards and advise on corrective actions which may include upgrading or downgrading PPE, engineering controls, or procedural changes.

2.1.2 Project Manager and Field Team Leader

The Engineer's PM has ultimate responsibility for ensuring implementation of the requirements set forth in this HASP/RPP. Some of this responsibility may be achieved through delegation to site-dedicated

personnel who report directly to the PM. The PM will regularly confer with site personnel regarding health and safety compliance.

The Engineer's Field Team Leader will have the day-to-day responsibility for ensuring implementation of the HASP/RPP while overseeing and directing field activities. Engineer subcontractor compliance with the HASP/RPP will be monitored by the Field Team Leader. The Field Team Leader will report directly to the PM any health and safety-related issues.

2.1.3 Health and Safety Representative

The Engineer's HSR is responsible for administration of the Engineer's company health and safety program. The HSR will advise the PM and site personnel regarding project-specific health and safety issues. The Engineer's PM will establish a liaison between officers and representatives of AIS and the HSR on matters relating to health and safety.

2.1.4 Site Safety Coordinator

SSCs are assigned by the PM and approved by the HSR to oversee health and safety of project activities. If qualified by experience and training, the SSC may also serve as the "competent person" as required by federal or state health and safety regulations (i.e. for excavations, asbestos, fall protection, and scaffolding). The HSR has the right and responsibility to review the scope of work and site hazards to ensure that the SSC selected is adequately trained and experienced to manage site safety. The SSC is responsible for the following:

- Being on site during all work activities or designating a qualified alternate SSC in his or her absence.
- Overseeing health and safety issues for the Engineer's employees, subcontractors, and visitors.
- Implementing hazard communication, respiratory protection, personal protective equipment (PPE), and other associated safety and health programs.
- Implementing the site-specific HASP/RPP.
- Verifying that on-site personnel read and understand site health and safety documents, such as HASPs, project-specific safety data sheets (SDS), and activity hazard analyses (AHA).
- Verifying that the HASP/RPP accurately reflects **all** site hazards and is revised or amended as new tasks are assigned or new hazards are recognized.
- Verifying on-site personnel have all necessary training, medical clearance, and respirator fit tests as specified by the HASP/RPP.

- Advising the PM and/or client of any field practices or conditions that may endanger the health and safety of field personnel, subcontractors, or visitors.
- Recommending corrective actions for any conditions that may endanger the health and safety of field personnel, subcontractors, or visitors.
- Selecting, inspecting, maintaining, and enforcing proper use, cleaning, and maintenance of protective clothing and equipment.
- Monitoring on-site hazards and conditions.
- Maintaining visual or verbal communication with all site workers.
- Stopping work if any worker feels that a work site condition, practice, or operation causes or presents a hazard that can reasonably be expected to result in immediate death, serious physical harm, or severe damage to the environment.
- Working closely with the PM to determine appropriate corrective action and/or prompt resolution to all hazards.
- Conducting daily health and safety briefings for site personnel and initial site training for new personnel.
- Establishing and maintaining work zones and control points by overseeing control of entry and exit at site access points. Recording names and job assignments of all personnel who enter and exit the site.
- Arranging for work area and personal or ambient hazard monitoring (for occupational exposure assessments related to inhalation, noise, heat/cold stress, and other potential exposure hazards).
- Ensuring that all monitoring equipment used on site has been properly calibrated and is operated in accordance with manufacturer's recommendations and approved sampling methodologies.
- Creating and maintaining records of employee exposure and monitoring results for all on-site personnel.
- Determining need for additional safety equipment (such as respirators or fall protection equipment), depending on planned tasks and site-specific conditions.
- Monitoring workers for signs of occupational health exposures, such as chemical exposure, heat stress, and fatigue.
- Conducting scheduled and unscheduled field site safety audits.
- Coordinating and supervising emergency response and providing emergency first aid and cardiopulmonary resuscitation (CPR) to team members, if required.
- Reporting all occupational illness, injuries, incidents, and near-misses to the HSR and PM immediately after stabilization of the incident.
- Assisting in preparing reports of illnesses, injuries, motor vehicle accidents, or property damage.

2.1.5 Engineer's Employees

Other employees of the Engineer may be present at the site during environmental monitoring and sample collection activities. The Engineer's employees will read and sign a site-specific HASP and RPP compliance agreement. The Engineer's employees are expected to fully participate in implementing the

site HASP/RPP by obtaining necessary training, attending site safety meetings, always wearing designated PPE, complying with site safety and health rules, and advising the Engineer's SSC of health and safety concerns at the site. Additionally, all Engineer employees have the following rights and responsibilities:

- Engineer employees are expected to report safety hazards they face while performing their work and are responsible for doing so. As such, employee reports of safety hazards shall be viewed as positive interactions and ***no employee of the Engineer will retaliate against any other employee who reports a safety hazard.***
- Engineer employees have the right to refuse to perform work involving significant safety hazards they feel have not been addressed.
- Every Engineer employee has the right to stop work if he or she feels any work site condition, practice, or operation causes or presents a hazard that can reasonably be expected to result in immediate death, serious physical harm, or severe damage to the environment.

2.1.6 Remediation Contractor Personnel

Remediation contractor personnel directly contracted by AIS at the site will be required to submit a separate site-specific HASP/RPP. Any subcontractors of the remediation contractor will comply with the remediation contractor's HASP/RPP or supplement the site-specific HASP/RPP with a separate HASP or HASP/RPP, as appropriate, encompassing the subcontractor's specific onsite activities. The remediation contractor and associated subcontractor HASP/RPP must meet all applicable OSHA and radiation requirements. Remediation contractor and associated subcontractor personnel must comply with all applicable 29 CFR Part 1910.120 training and IEMA requirements in Title 32 of the Illinois Administrative Code, including all relevant training, fit testing, and medical surveillance requirements, as specified in the remediation contractor's site-specific HASP/RPP and associated task hazard analysis. The remediation contractor and associated subcontractor personnel are responsible for providing PPE required by their HASP/RPP for their personnel and are directly responsible for the health and safety of their employees.

2.1.7 Excavation Competent Person (Remediation Contractor)

The remediation contractor will provide a competent person for trenching and excavation activities in accordance with 29 CFR §1926.651. Responsibilities of the competent person include:

- Perform daily inspection of protection equipment, trench conditions, and adjacent areas.
- Conduct inspections prior to start of work and as needed throughout the shift.
- Conduct inspections after every rainstorm or other occurrence that could increase hazard.

- Remove employees from hazardous conditions and make all changes necessary to ensure their safety.
- Categorize soil conditions and conduct visual and manual tests as a preliminary effort.
- Determine the appropriate protection system to be used.
- Obtain appropriate permits and supply necessary notices when needed (such as Confined Space Permit or Hot Work Permit).
- Maintain on-site records in relation to all excavation and trenching activities, including inspections.

All activities will be conducted in accordance with the requirements of 29 CFR §1926.651, as well as specific excavation requirements identified in the remediation contractor's HASP/RPP. Furthermore, inspections conducted by the subcontractor competent person will be documented on a remediation contractor-supplied form or document; this documentation will be maintained throughout the project.

2.1.8 Visitors

All site visitors will be required to read the Engineer's and remediation contractor's HASP/RPP and sign the Engineer's HASP/RPP Compliance Agreement form. Visitors will be expected to comply with relevant OSHA requirements. The RSO may also provide visitors with site-specific radiological training, as required. Visitors will also be expected to provide their own PPE required by the HASP/RPP. Visitors who have not met OSHA and radiological training, medical surveillance, and PPE requirements are not permitted to enter areas where exposure to radiation hazards or hazardous materials is possible.

2.2 HASP AND RPP ENFORCEMENT

HASP/RPP enforcement on the site will be rigorous. Violators of the HASP/RPPs will be verbally notified on first violation, and the violation will be recorded by the Engineer's SSC in a field logbook. On second violation, the violator will be notified in writing, and the Engineer's PM and the violator's supervisor will be notified. A third violation will result in a written notification and eviction of the violator from the site. The written notification will be sent to human resources development and the HSR.

Personnel will be encouraged to report to the SSC any conditions or practices that they consider detrimental to their health or safety, or those they believe are in violation of applicable health and safety standards. These reports may be transmitted orally or in writing. Personnel who believe that an imminent danger threatens human health or the environment are encouraged to stop work and bring the matter to the immediate attention of the SSC for resolution.

At least one copy of this HASP/RPP will be available to all site personnel at all times. The remediation contractor shall also make at least one copy of their HASP/RPP available to all site personnel at all times. Remediation contractor and associated subcontractor HASP/RPP(s) enforcement is the responsibility of the remediation contractor.

The daily tailgate safety meetings will encompass relevant safety topics for the day's scope of work. The Engineer's SSC will discuss minor changes in HASP/RPP procedures at the beginning of each work day at the daily tailgate safety meeting. The daily tailgate safety meeting will be led by the Engineer's SSC and RSO in close coordination with AIS's remediation contractor's competent person and RSO. Significant plan revisions must be reviewed and approved by the Engineer's HSR, and discussed with the PM.

3.0 SITE BACKGROUND

From about 1916 to 1921, Carnotite operated an elemental radium separation and refining facility in Chicago at 2600 S. Inglehart Place, a street that no longer exists (HBK Engineering, LLC [HBK] 2012). Carnotite was near what is now 434 E. 26th Street, Chicago, Illinois. This property later became part of the land occupied by the former Michael Reese Hospital. In 1979, the State of Illinois Department of Health, Division of Radiological Health, in cooperation with the U.S. Environmental Protection Agency (EPA), conducted a radiological surface survey of part of the Michael Reese property and identified several areas of elevated radioactivity. State personnel concluded that the contamination did not pose an immediate health hazard, but should be considered prior to any future construction. In September 2008, the owner of Michael Reese filed a petition for bankruptcy protection in the U.S. Bankruptcy Court for the Northern District of Illinois. Anticipating selection of Chicago as host of the 2016 Olympic Games, the City of Chicago purchased the 37-acre former Michael Reese property in June 2009. The City planned to develop the property as the site of the Olympic Village. In August 2009, IEMA conducted a gamma surface survey, observed readings of gamma activity, and recommended to the City of Chicago further investigation of gamma activity prior to invasive construction work (AECOM Technical Services, Inc. [AECOM] 2011a). In December 2009, EPA conducted a surface gamma survey at the site and confirmed presence of elevated surficial gamma activity (EPA 2009). In June 2012, subsurface investigations confirmed the presence of elevated levels of radium and uranium in subsurface soil (AECOM 2012a). In October 2013, at the City of Chicago's request, the IEMA Division of Nuclear Safety became the lead regulatory agency for the site (former Michael Reese Site) (AIS 2013); pursuant to this determination, AIS obtained radioactive material storage license IL-02467-01 from IEMA in 2015. AIS received the most recent license amendment on October 1, 2018 (IEMA 2018).

3.1 SITE DESCRIPTION

The site is at 434 East 26th Street on the northern portion of the former Michael Reese Hospital campus in Chicago, Cook County, Illinois (Figure 1). The site is currently owned by the City of Chicago. The site boundary is defined in the proposed radioactive material license, based on property boundaries to the north, east, southwest, and west. The southernmost site boundary is defined by reference to results of former investigations that did not identify radioactive contamination above background levels south of the current boundary (AECOM 2013, 2014). The 7-acre site is bordered north by Advocate Health Center, east by the Metra South Shore rail line, south by vacant property and residential property, and west by Dr. Martin Luther King, Jr. (King) Drive and residential property across King Drive (Figure 1). Radium, uranium, and thorium contamination is present within the central and western portions of the site,

believed to have resulted from Carnotite's refining operations in the early 1900s. Based on results of previous investigations at the site, including surficial gamma surveys, down-hole gamma logging, and analyses of soil samples, the estimated extent of radiological contamination is limited to the central and western portions of the site (see Figures 2 and 3). Most impacted material is limited to the top 5 feet below ground surface (bgs). However, contamination extends to 14 feet bgs within one area in the northwest portion of the site (AECOM 2012a).

The site is 0.25 miles west of Lake Michigan and 1.20 miles southeast of the Chicago River (see Figure 1). Most of the western portion of the site is vegetated and consists of an open field (formerly a baseball field) with some trees. The southern central portion of the site is paved and consists of a former basketball court and tennis courts. The eastern and northern portions of the site consist of a concrete slab and asphalt parking lot remaining from former Michael Reese Hospital campus Building No. 1. The site is split into northwestern and southeastern sections by East 26th Street and South Ellis Avenue. East 26th Street enters the site on the east side of the intersection of South King Drive near the northwestern corner of the site. East 26th Street then travels southeast through the site, eventually becoming South Ellis Avenue. South Ellis Avenue exits the south-central portion of the site and extends south to the intersection of South Ellis Avenue and 27th Street (see Figure 2). A fence surrounds both the northeastern and southwestern portions of the site.

Borings advanced by AECOM during a subsurface investigation indicated three distinct soil/fill types underlying the Carnotite site. The first type was demolition debris apparently used to fill historical foundations that predate construction of Michael Reese Hospital. This demolition material consisted of sand, gravel, and concrete with traces of brick and cinders. The second type, brown to black fill soil, ranged from a fine to medium sand to silty clay and contained minor amounts of gravel and cinders. The third soil type, a native tan to brown fine sand, was encountered in a majority of the borings. The native sand was typically encountered at a depth of 4 to 6 feet bgs but was slightly deeper where historical foundations were present. An exception to this was in the vicinity of the tennis courts where native sand was not encountered within the first 12 feet, the maximum depth of the borings. Subsequent investigation of other areas of the former Michael Reese Hospital complex, mostly outside the Carnotite site boundary, found the same three soil or fill types at similar depths (AECOM 2012a and 2014).

Regional geology generally consists of unconsolidated glacial deposits about 50 feet thick overlying Silurian bedrock. The site is underlain by the Chicago Lake Plain sediments and the Wadsworth Till Member—a clayey gray till. The Wadsworth Till Member is a glacial till and a part of the Wedron Formation. In the Chicago area, undisturbed Chicago Lake Plain sediments are primarily fine-grained silt

and clay. At the site, urban fill and lake-bottom sand was observed to approximately 30 feet bgs. Clay was observed between 25 and 30 feet bgs (CH2MHILL 2008).

Four major groundwater aquifers are recognized in northeastern Illinois: the Pleistocene glacial drift (shallow) aquifer, Silurian dolomite aquifer, Cambro-Ordovician aquifer, and Cambrian Mt. Simon sandstone aquifer. Historical site information indicates that shallow groundwater generally flows northeast toward Lake Michigan. Unless disturbed or breached, the native clay underlying the shallow fill and sandy lake deposits forms an effective aquitard that inhibits significant vertical migration of shallow groundwater into the clay. Monitoring well water levels measured during May 5 to 7, 2008, indicate an easterly flow direction toward Lake Michigan in the shallow groundwater. Saturated conditions in the Phase II borings were generally encountered between 6 and 12 feet bgs across the site, indicating presence of a continuous groundwater unit within the sandy geologic material (CH2MHILL 2008).

Well records from the Illinois State Geological Survey indicate 28 groundwater wells registered within a 1-mile radius of the site. Most of these wells are screened in Silurian bedrock from 70 to 1,937 feet bgs (EDI 2009). However, these wells are believed to be inactive because the City of Chicago Department of Water Management supplies drinking water from Lake Michigan to the City of Chicago. Also, City of Chicago municipal code Chapter 11-8 prohibits installation of new potable supply wells.

Natural surface drainage patterns at the site have been altered by construction and demolition activities. Ground surface elevations range from 591 feet above mean sea level (MSL) near the southeast corner of the site to 600 feet above MSL near the center of the site. Overland flow is minimal due to relatively flat topography. Flooding is not expected at the site, as the site is not within 100-year or 500-year floodplains (EDI 2009).

3.2 SITE HISTORY

From about 1916 to 1921, Carnotite operated an elemental radium separation and refining facility at the site. Based on a 1911 Sanborn map, Conrad Seipp Brewing Company occupied the Carnotite site area prior to Carnotite operations (EDI 2008). The time period of Carnotite's operation is not covered by available historic records; therefore, the Carnotite site was not identified during previous Phase I and II ESAs (EDI 2008 and 2009; CH2MHILL 2008).

During the time period of Carnotite operations, uranium ore called carnotite was likely the primary raw material from which radium was extracted and concentrated. Although the carnotite ore was relatively rich in uranium, concentrations of radium were only in the milligrams per kilogram (mg/kg) range (i.e.,

parts per million [ppm]). Thus, large amounts of ore were required to produce relatively small amounts of radium. Most radium production sites in the early 1900s produced only a few grams of radium each year. However, production of a few grams would have required hundreds of tons of uranium ore. The separation methods used to isolate radium also separated and concentrated uranium from the origin ore during the radium recovery process. Based on historical U.S. Patent Office documents, Carnotite radium recovery operations included rotating the carnotite ore in drums or barrels, followed by treatment with an aqueous solution of sulfuric and hydrochloric acids. Addition of sulfuric acid facilitated formation of barium and radium sulfates, which remained insoluble during the treatment process, thereby facilitating the radium concentration process. The mixture was dried and baked at 250 degrees Celsius to drive off the water. The resultant “green slime” was further treated with a dilute solution of hydrofluoric acid and water to further concentrate the radium sulfate. An estimated 20 pounds of material containing radium, which was further refined, was produced from 1 ton of carnotite ore (U.S. Patent Office 1916 and 1919). Because radium was the primary focus, the extracted uranium would likely have become a waste. As a result, radionuclides of concern include both radium and uranium.

3.3 FORMER SITE INVESTIGATIONS

Previous Phase I and Phase II environmental site assessments (ESA) documented non-radiological contamination at the site; however, the focus of the current environmental monitoring addressed by this HASP/RPP is the evaluation of existing concentrations of radionuclides in air and groundwater to demonstrate that public doses do not exceed standards in 32 *Illinois Administrative Code* (IAC) 340.310. Previous radiological site investigations discussed below have documented elevated gamma readings in surface and subsurface soil, as well as elevated levels of radium and uranium in subsurface soil. Previous investigations have also delineated the extent of contamination at the site.

Phase I and II ESAs

On August 8, 2008, Environmental Design International, Inc. (EDI) submitted a Phase I Environmental Site Assessment (ESA) Update Report to CH2M HILL regarding the facility described as the Michael Reese Hospital and Medical Center, which included the site. This assessment revealed evidence of recognized environmental conditions (REC) in connection with the former Michael Reese Hospital facility. EDI also identified data gaps in historical information regarding the facility, particularly during the period of 1912 through 1949, and during the 1950s, 1960s, and early 1970s (EDI 2008).

On August 8, 2008, CH2M HILL prepared a Phase II ESA Report regarding the facility described as the Michael Reese Hospital site, which included the site. Fieldwork occurred in two phases—from May 5 to 14 (Phase IIa), and from June 12 to 13, 2008 (Phase IIb). A total of 127 soil samples and 53 groundwater

samples were collected for laboratory analysis during the two field efforts. Broad spectrum chemical analyses of the soil and groundwater samples occurred for volatile organic compounds (VOC), semivolatile organic compounds (SVOC), pesticides, polychlorinated biphenyls (PCB), and metals. Approximately 58 percent of the soil samples collected at the site and nearby areas contained contaminant concentration(s) exceeding one or more Tiered Approach to Cleanup Objectives (TACO) Tier 1 residential criteria. An evaluation of the groundwater data acquired at the site documented TACO Tier 1, Class I groundwater criteria exceedances by concentrations of lead, arsenic, chromium, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, indeno(123-cd)pyrene, and chloroform. Approximately 75 percent of the groundwater samples collected at the site contained contaminant concentration(s) exceeding one or more TACO Tier 1 residential criteria, principally lead concentrations (C2HM HILL 2008).

On June 26, 2009, EDI submitted a Phase I ESA Update Report regarding the facility described as the Michael Reese Hospital and Medical Center, which included the site. The updated Phase I ESA Report included addition of RECs per conclusions and results from the Phase II ESA completed by C2HM HILL on August 8, 2008. The report also included information obtained from the Office of the Illinois State Fire Marshal (OSFM) indicating an issued a notice of violation to the facility regarding eight USTs associated with the facility (EDI 2009).

Radiological Site Investigations

IEMA visited the former Michael Reese Hospital to close out radiological licenses at the former hospital and to scan the former hospital buildings. Through a record review, IEMA discovered a letter regarding a 1979 gamma survey related to the former Carnotite site. On August 12, 2009, IEMA conducted a gamma surface survey of the site area. On August 18, 2009, in a letter to the City of Chicago Department of Environment (DOE), IEMA indicated that the observed gamma readings did not pose an immediate health risk, but recommended additional characterization prior to invasive construction activities at the site (AECOM 2011a and 2014).

On December 11, 2009, EPA conducted a gamma surface survey of the site and confirmed presence of elevated surficial gamma activity. EPA provided DOE an aerial image depicting a color-coded data point overlay of the surface gamma readings, but gamma reading values were not provided (EPA 2009).

DOE evaluated historical documents to assess development of the site that took place during the early 1900s. DOE determined that Carnotite had operated on site from about 1916 until 1921. It was purchased by Tungsten Products Company (Boulder, Colorado) when it went out of business in 1920. Tungsten Products Company had recently merged with the Radium Company of Colorado. Information

on Tungsten Products or the Radium Company after 1926 could not be found. On March 14, 1979, the IDPH, Division of Radiological Health (a predecessor organization to IEMA), in cooperation with EPA, surveyed the area of what was thought to be the site. Most of the site at that time was part of the Michael Reese Medical Center. Radiation levels were found relatively low, and because of the depth of the radioactive material and the geographical location, IDPH determined that no immediate health hazard was apparent (IDPH 1979).

On January 26, 2011, AECOM completed an interior radiological survey of Building No. 1 and provided a letter report to the Chicago Public Building Commission (PBC) titled “Interior Radiological Survey Results for Building No. 1 – Former Carnotite Reduction Company Investigation.” The investigation area consisted of a large building within the northeast portion of the site (Building No. 1) that was part of the former Michael Reese Hospital complex. AECOM had conducted the gamma surface survey using Ludlum Model 2221 meters and unshielded 2- x 2-inch sodium iodide (NaI) probes (Model 44-10). Field instrumentation background for the interior slab of approximately 5,150 cpm was established based on six readings taken within the building and away from the exterior walls. Maximum readings from the floor slab survey grids ranged from 4,800 to 9,300 cpm. The southwest corner of the building was not surveyed because debris/conditions limited access. In addition to the main building area, the concrete slab within the covered walkway extending south from the southeast corner of the building was also surveyed on December 13, 2010. Gamma readings did not indicate elevated conditions, and results (grid maximums) ranged from 6,100 to 7,200 cpm. Thus, the interior floor surveys did not indicate elevated gamma readings that could indicate presence of radiologically-impacted soil beneath the concrete slabs. Based on the survey results, AECOM determined that a radiological exposure issue for the public and/or construction workers did not exist, as long as the pavement would remain appreciably intact and soil beneath the slab would not be exposed. The recommendation was based on identification of several projects where known radiological impacts had existed beneath paved surfaces in public areas (i.e., parking lots), but EPA had allowed continued use of the areas as long as the paved surface would be maintained (AECOM 2011a).

On February 8, 2011, AECOM completed a radiological surface gamma survey and provided a letter report to the PBC titled “Radiological Surface Gamma Survey Results – Former Carnotite Reduction Company Investigation.” The investigation area included grassed and paved surfaces, as well as Building No. 1 that was part of the former Michael Reese Hospital complex but based on its year of construction (1948), was not associated with Carnotite. The surface gamma survey utilized an unshielded Ludlum 2221 meter-scaler with a 2- x 2-inch NaI probe. Surface readings were recorded continuously and logged at a minimum of every 2 seconds along with Global Positioning System (GPS) coordinates as the

operator traversed the investigation area. The individual traverses were spaced approximately 3 feet apart and generally parallel to the boundaries of the screening area. The field instrumentation surface gamma background value was calculated to be approximately 4,050 cpm for paved surfaces and 6,815 cpm for soil or grassed areas. Because cleanup criteria and an equivalent field instrumentation threshold had not been established for the site, elevated gamma readings were defined as readings exceeding twice background. Based on the benchmark of twice the paved background value (8,100 cpm), a significant portion of the investigation area (predominantly the southern and eastern portions) had surface gamma readings not indicative of radiologically-impacted material. The surface gamma survey encountered elevated gamma readings in the northwest portion of the investigation area adjacent to and likely beneath East 26th Street (see Figure 3). Peak gamma responses exceeded 90,000 cpm within an area west of the former Building No. 1 and near the East 26th Street curb line. The results indicated that the paved road surface was likely providing significant shielding, and the radiologically-impacted soil likely extended into or was contiguous beneath the street. The areas of elevated gamma response were generally consistent with results of previous smaller scale surface gamma studies by IEMA and EPA (AECOM 2011b).

In June 2012, EPA conducted a radiological surface gamma survey of the site and of properties in the vicinity of the site (readings were in counts per second [cps]). Three figures were provided—aerial images of the site and the area in the vicinity of the site. The figures included color-coded point data overlays of the surface gamma readings. The highest total gamma cps survey readings were encountered along 26th Street, particularly in the northwest portion of the site and at the northern edge of the tennis courts (EPA 2012).

On June 11, 2012, AECOM completed a down-hole gamma survey of the site and submitted a final report titled “Subsurface Gamma Screening Results (Final) – Former Carnotite Reduction Company” to the PBC. The down-hole surveys utilized a Ludlum 2221 rater-scaler with a 0.5- by 1-inch NaI probe Model 4462 that was equipped with a 1-inch lead end-cap. The purpose of the lead end-cap was to shield gamma radiation from below the probe so that the readings as much as possible reflected the gamma radiation encountered laterally from the probe. A Geoprobe rig was utilized to advance the boreholes and collect samples for radioisotope analyses. A total of 215 borings were advanced, down-hole logged, and position-located by use of GPS instrumentation. Down-hole gamma readings ranged from <1,000 cpm to over 230,000 cpm. In general, the native sand was encountered at about 6 feet bgs, but at greater depths where historical foundations were present. A total of 58 soil samples were selected for gamma spectroscopy analysis. A balance of clean and impacted surface samples (0 to 2 feet bgs) were selected, as well as a group of subsurface samples that had exhibited a range of gamma counts. In the 58 samples

analyzed at the laboratory via gamma spectroscopy, total uranium activity ranged from non-detect to 3,670 picocuries per gram (pCi/g), and total radium activity ranged from 0.85 to 1,181 pCi/g (AECOM 2012a).

On October 22, 2012, AECOM completed a radiological surface surveillance for demolition operations of Building No. 1, and provided a letter report to the PBC titled “Radiological Surface Surveillance of Demolition Operations for Building No. 1 – Former Carnotite Reduction Company Investigation.” AECOM applied the same methods described in the “Radiological Surface Gamma Survey Results – Former Carnotite Reduction Company Investigation” letter report to conduct ground surface gamma surveys. Field gamma measurements reported during radiological surveying prior to and during demolition of Building No. 1 did not exceed the respective “twice-background” threshold limits previously cited, and ranged from 7,800 to 13,700 cpm unshielded. Thus, no presence of radiologically-contaminated material was indicated (AECOM 2012b).

On October 31, 2012, AECOM completed a surface gamma survey and provided a letter report to the PBC titled “Draft-Radiological Surface Gamma Survey Results - Former Michael Reese Hospital site.” The September 2012 investigation area included South Vernon and South Ellis Avenues north of East 29th Street, as well as a flat, grass-covered area west of South Ellis Avenue, which is south of the site. AECOM applied the same methods described in the “Radiological Surface Gamma Survey Results – Former Carnotite Reduction Company Investigation” letter report to conduct ground surface gamma surveys. Results of the September 2012 survey within the paved areas did not indicate gamma readings greater than twice background for paved areas. Gamma readings within the vegetated or soil covered surfaces were all less than 13,000 cpm—substantially less than twice the background value for these surfaces. Thus, gamma readings taken during the September 2012 survey did not indicate results indicative of surface or near-surface radiological contamination (AECOM 2012c).

On February 1, 2013, Prairie Shores Apartments (Prairie Shores) submitted a letter to IEMA regarding radiological surveys of the apartment buildings and grounds. Prairie Shores is south-southwest of the site. At Prairie Shores, Radiation Safety Services, Inc. (RSSI) had conducted short- and long-term radon monitoring utilizing alpha track radon monitors, surface radiation surveys by use of a Ludlum Model 44-10 side-shielded probes connected to Ludlum 193 alarming rate meters, and dose rate surveys utilizing Health Physics Instrument Model 1010 tissue-equivalent dose-rate meters. Short-term radon monitoring indicated radon measurements from <0.3 to 1.7 pCi/L (picocuries per liter). Long-term radon monitoring indicated radon measurements from 0.8 to 2.9 pCi/L. Surface radium survey readings did not exceed 2,000 cpm except for a range from 6,000 to 8,000 cpm within a localized area adjacent to the base of a

freestanding brick wall at the east edge of the parking lot east of Vernon Avenue and opposite Prairie Shores Building 3. Background dose rate at Prairie Shores was measured at approximately 0.006 micro roentgens per hour (mrad/hr). Dose rates exceeded background only at the east and west base of the brick wall (ranging from 0.014 to 0.026 mrad/hr), with surface radium survey readings of 6,000 to 8,000 cpm. Dose rates ranged from 0.008 to 0.014 mrad/hr at three other locations, including a green space between the west side of Prairie Shores building and King Drive, a localized area on unpaved land north of Prairie Shores Building 5 parking lot, and two localized areas of the paved circular drive north of Prairie Shores Building 4. Based on results of the evaluation and health-based standards applied by IEMA, Prairie Shores concluded that no actionable public health risk existed on the Prairie Shores property as a result of radiological contamination associated with the site. Prairie Shores requested a review of the evaluation results by IEMA to confirm absence of actionable public health risk, to determine if IEMA would recommend remediation of two discrete areas of contamination, and if IEMA would consider release of the Prairie Shores property for unrestricted use (Prairie Shores 2013).

On March 4, 2013, IEMA responded to the Prairie Shores “Prairie Shores Apartments – Radiological Investigations” letter report. IEMA concurred with the methodology utilized by RSSI to conduct the cursory site investigation. IEMA suggested both near surface and subsurface soil sampling investigations, combined with down-hole gamma surveys, to fully characterize and delineate lateral and vertical extents of possibly present contamination. IEMA recommended analyses of samples for total radium and total uranium. IEMA stated that without data further characterizing the Prairie Shores property, a public health risk related to possibly present radiological contamination at the Prairie Shores property could not be confirmed or refuted (IEMA 2013).

On May 23, 2013, EPA submitted a letter to the City of Chicago Department of Law, Aviation, Environmental, Regulatory & Contracts Division that conveyed a cost estimate for cleanup of the site to the City of Chicago. EPA had prepared a rough draft, order of magnitude cost estimate for cleanup of certain environmental contamination on the property. EPA based the estimate on cleanup of likely contaminants of concern including arsenic, lead, radium, and uranium, and respective cleanup criteria of 13.1 ppm, 400 ppm, 7.1 pCi/g, and 20 pCi/g. EPA also incorporated boring data acquired by AECOM, and assumed GPS identification of elevated areas, programmable heavy equipment using GPS readings to direct work, and transport of radioactively contaminated material to properly licensed disposal facilities in compliance with EPA off-site policies. Without an exact volume of contaminated soils determined, EPA’s preliminary estimate indicated a cost of approximately \$23 million to conduct cleanup work (EPA 2013).

On June 28, 2013, AECOM submitted a letter report to AIS titled “Radiological Surface Gamma and Dose Rate Survey Results – Former Michael Reese Hospital Site.” At the time of the report, the former Michael Reese Hospital facility, which included the site, was covered primarily by vegetation/soil, gravel/crushed concrete surfaces, and paved surfaces (streets and sidewalks). In April 2013, AIS authorized AECOM to conduct a similar surface gamma survey east of S. Vernon and S. Ellis Avenues, north of E. 29th Street, south of E.27th Street, and west of the Metra rail corridor. AECOM applied the same methods described in the “Radiological Surface Gamma Survey Results – Former Carnotite Reduction Company Investigation” letter report to conduct ground surface gamma surveys. The twice background value for the paved areas slightly exceeded 10,068 cpm. Results from both the September 2012 and April 2013 surveys of the paved areas did not indicate gamma readings greater than twice background for paved areas. Gamma readings from the vegetated or soil-covered surfaces were less than 13,000 cpm and substantially less than twice the background value for these surfaces. Thus, gamma readings taken during the September 2012 and April 2013 surveys did not indicate presence of surface or near-surface radiological contamination. A primary goal of the September 2012 and April 2013 surface surveys was to determine if radiological contamination was present that could represent a potential human health exposure issue. Survey results did not indicate presence of radiological contamination at or in the near surface soil of the investigation area. Therefore, no radiological concern with surface soil in the survey areas was indicated. Limitations of Ludlum instrumentation surveys, especially shielding effects, restrict the surface gamma screening technique to the upper 1.5 feet of soil and 1 foot or less of paved areas. Thus, conclusions regarding absence of radiological contamination should not be extrapolated to soil beneath pavement or to depths exceeding 1.5 feet below unpaved surfaces. Dose rates were measured by use of a Bicron MicroRem. Dose rate results within areas outside of the area of known contamination ranged from 3 to 7 micro rems per hour (micro-rem/hr) at the surface, and appeared to be at background level for the areas. These areas include the former park and playground area, and the former building and parking lot areas north of E. 29th Street. Within the area of known contamination, the dose rates measured at the surface ranged from 3 to 55 micro-rem/hr, with an average of 13 micro-rem/hr. The relatively small areas with the highest measured dose rates were consistent with areas of high levels of surface gamma activity indicated in data acquired during the original December 2010 and January 2011 surface surveys. Because the areas with highest dose rates were small, AECOM determined that exceedance of the Nuclear Regulatory Commission’s (NRC) annual dose limit was not a realistic expectation (AECOM 2013).

On December 4, 2013, IDPH provided a Letter Health Consultation regarding the site. The health consultation indicated that public dose rates for commuters traversing accessible portions of the site were not expected to exceed acceptable dose limits (IDPH 2013).

On May 22, 2014, AECOM submitted a report to AIS titled “Subsurface Gamma Screening Report – Former Michael Reese Hospital Campus.” As previous surface and subsurface studies focused on the delineation of radiological contamination near the northern boundary of the former Michael Reese Hospital campus, the purpose of the investigations discussed in this report was to collect data to substantiate that radiological contamination was not present on other portions of the former campus. The subsurface investigation included down-hole gamma surveys at 29 soil borings. The investigation also included collection and analysis of select soil samples from several of the soil borings. The 29 borings were advanced at locations predetermined by AIS. Two of the borings, B-27 and B-29, were advanced at locations within the current radioactive material license area, near the eastern boundary of the area. AECOM applied a method for the down-hole gamma survey and soil sample collection similar to that described in the “Subsurface Gamma Screening Results (Final) – Former Carnotite Reduction Company” report. Down-hole gamma survey measurements were taken from each of the 29 soil borings. Down-hole gamma readings from the fill soil ranged from 260 to 2,078 cpm—less than twice the field instrument background value of 2,500 cpm. Therefore, no elevated subsurface gamma readings indicative of potential radiological contamination were encountered at the 29 boring locations. Fill soil samples were collected from select borings and submitted for gamma spectroscopy. The samples were selected to represent a range of gamma readings encountered, as well as spatial distribution across the investigation area. While cleanup criteria had not been established for the site, review of the gamma results indicated that none of the 10 samples had total radium or uranium activities that would be inconsistent with background soil conditions or likely to be considered as indicative of contamination related to Carnotite operations (AECOM 2014).

In October 2016, Tetra Tech prepared a dose assessment report for uranium soil cleanup objective determination. The dose assessment report’s primary purposes were to establish a uranium soil cleanup objective consistent with standards in 32 IAC 340.310 and to determine if additional groundwater sampling was needed at the Carnotite site. A uranium soil cleanup objective of 187 pCi/g was calculated based on a set of soil-based exposure pathways assuming a conservative residential scenario and using the Residual Radioactivity (RESRAD)-ONSITE modeling program. Subsequently, the RESRAD-OFFSITE modeling program was used to evaluate whether soil at the Carnotite site may adversely impact receptors exposed via surface water from Lake Michigan, about 0.25 mile east and downgradient of the Carnotite site. Based on a total uranium soil concentration of 3,670 pCi/g (the maximum detected concentration of total uranium in site soil), the maximum dose to receptors potentially exposed via ingestion of surface water and fish tissue from Lake Michigan downgradient of the Carnotite site was established at 5.859E-07 mrem/yr. This dose is well below the allowable annual dose of 25 mrem/yr. Finally, the RESRAD-OFFSITE modeling program was used to evaluate hypothetical use of groundwater as drinking water and

resulting dose estimates. Based on a total uranium soil concentration of 3,670 pCi/g, the maximum dose is 6E-01 mrem/yr for a drinking water well located at the Carnotite site boundary; again, well below the allowable annual dose (Tetra Tech 2016a).

On April 3, 2017, Tetra Tech collected two soil samples for remediation planning. The soil samples were collected from areas along 26th Street known to be contaminated. One sample was collected from 2.5 feet bgs and another from the surface. Ra-226 was detected from 57.9 to 592 pCi/g, Th-230 was detected from 106 to 445 pCi/g, and total uranium was detected from 36.5 to 48 pCi/g (Tetra Tech 2017a).

In July 2018, Tetra Tech conducted a pre-design investigation to further delineate Ra-226, Th-230, and total uranium contamination in soil; confirm depth to a confining clay layer for evaluating shoring requirements; and acquire groundwater data for design of dewatering and pre-treatment systems. Existing groundwater monitoring wells were sampled; a new groundwater monitoring well (MW-1) was installed and sampled; and 18 investigative, seven background, and three waste characterization soil borings were advanced. Also, XRF screening was conducted for select soil samples. Of 65 investigative soil samples collected within 0 and 30 feet bgs, nine contained Ra-226, total uranium, or Th-230 above site-specific soil remediation criteria at depths between 0 and 6 feet bgs. These exceedances were detected only within previously identified contaminated areas. No Ra-226, total uranium, or Th-230 soil concentrations exceeded soil remediation criteria outside of the horizontal or vertical footprint of the established contamination area. In addition, no soil remediation criteria were exceeded in the 33 soil samples collected below the water table. No borings could be installed west of the plume area along 26th Street and east of Martin Luther King Drive due to access issues and the presence of utilities. However, the extent of contamination in these areas was defined during the 2012 subsurface investigation. In 2012, no contamination was detected above site-specific concentrations of concern in soil analytical or gamma screening results collected west of the contaminated area. Also, the results indicate that uranium and thorium are not likely present outside the previously delineated areas of contamination.

XRF data collected during the investigation were compared with laboratory results. XRF and laboratory analytical results were similar for uranium concentrations detected by the XRF analyzer above 50 ppm. For total uranium concentrations near the XRF detection limit range of 15 to 25 ppm, the difference between XRF and laboratory analytical results was greater but remained within the acceptable range of difference between soil duplicate samples. However, the total uranium COC at depths less than 5 meters is 22 pCi/g, which is less than or within the XRF detection range. Therefore, total uranium concentrations near the COC may not be detected by the XRF. Accurate determination of Th-230 concentrations in soil by use of field screening with an XRF was found to be impractical because XRF

results were not consistent with analytical results. Other study objectives achieved included: (1) confirmation of the depth to clay at 31 to 33 feet bgs; (2) establishment of Th-230 background concentration of 0.842 pCi/g and, as a result, a tTh-230 remediation objective of 5.8 pCi/g; (3) acquisition of groundwater analytical results for wastewater treatment design and discharge purposes; and (4) confirmation that groundwater analytical results do not exceed site-specific groundwater remediation criteria (Tetra Tech 2018a).

In December 2018, GSG Consultants, Inc. (GSG) conducted a geotechnical investigation in the north contaminated area where deep excavation to 14 to 15 feet bgs is planned during site remediation activities. Three soil borings were advanced at the northwest, east, and southwest boundary of the expected deep excavation area to explore the subsurface conditions, to determine engineering properties of the subsurface soil, and develop sheet piling design and construction recommendations.

Representative soil samples were tested for moisture content, Atterberg Limits, and dry unit weight. Soil borings were advanced to between 61 and 71 feet bgs. In the borings, fill material was observed from the surface to between 3.5 and 6.5 feet bgs. Beneath the fill, loose to medium dense sand was observed to depths of between 26 and 31 feet bgs. Clay and silty clay was encountered below the sand to boring depths of between 61 and 63.5 feet bgs. Two borings were terminated at 61 and 61.5 feet upon encountering auger refusal on hard silty clay soils. The third boring noted dense to very dense silt with traces of clay and limestone fragments between 63.5 and 71 feet bgs. Groundwater was encountered at depths ranging from 8.5 to 18.5 feet bgs (GSG 2019a). GSG also determined minimum excavation slope requirements for the site remediation activities based on the results of the geotechnical investigation. The following side slopes were recommended (GSG 2019b):

- For excavations up to 15 feet bgs - 2.5H:1V
- For excavations 7.5 feet bgs or less - 2H:1V
- For excavations 5 feet bgs or less - 1.5H:1V

In December 2018, Tetra Tech conducted a hydrogeologic assessment at the site. The assessment was performed to support the remedial design. Slug tests and surveying of existing monitoring wells ASC-2A, ASC-5, and MW-1 were conducted to determine groundwater flow rate. Groundwater flow rate was used to facilitate design of excavation dewatering and groundwater treatment remediation activities. Hydraulic conductivity in the on-site wells ranged from 1.69×10^{-3} centimeters per second (cm/sec) in MW-1 to 7.17×10^{-3} cm/sec in ASC-5 (Tetra Tech 2019a).

In January 2019, Tetra Tech conducted a soil boring investigation to determine the maximum depth of contamination located beneath the northern portion of 26th Street and along the north property boundary.

The maximum depth of contamination above site-specific soil remediation criteria was determined to be 14 feet bgs. Total uranium was detected in soil up to 41 pCi/g and to depths of up to 14 feet. Ra-226 was detected in soil up to 26.9 pCi/g and Th-230 was detected up to 89 pCi/g, both within previous maximum depth ranges of 7 feet bgs or less. Soil boring logs confirmed subsurface conditions consistent with previous investigations. In March 2019, Tetra Tech advanced a hand boring to confirm the eastern extent of surficial Th-230 contamination along the northern portion of 26th Street. Ra-226, total uranium, or Th-230 were not detected at concentrations above the site-specific soil remediation criteria (Tetra Tech 2019b).

In July 2019, at the request of the City's Department of Water Management, AIS conducted a sewer investigation in planned excavation areas to determine if any unknown connections to the combined sewers exist prior to removal of the sewers during remediation activities. During the investigation, the sewers were cleaned by hydro-jetting, if possible, and televised. Two previously unknown sewer connections to the north 26th Street sewer from the adjacent property to the north were discovered. In addition, the sewer along north 26th Street was observed to be in poor condition in some locations (Tetra Tech 2019c).

In summary, investigations at the site since 2009 have identified the presence of gamma activity. A subsurface investigation in June 2012 confirmed the presence of elevated levels of radium and uranium in subsurface soil. Soil sampling in 2017 and the pre-design investigation in 2018 confirmed the presence of Th-230. The 2018 pre-design investigation also delineated the extent of Ra-226, total uranium and Th-230 soil contamination. The City (AIS) was required to obtain a radioactive facility license with the IEMA because of the discovery of radionuclide contamination associated with the former Carnotite site and the need to address the contamination in accordance with state and federal requirements. IEMA is the lead regulatory agency that oversees the proper management and remediation of radionuclide-contaminated sites in Illinois.

3.4 PLANNED ACTIVITIES

The Engineer and RSO field activities to occur during site remediation activities at the site are provided in the Introduction, Section 1.0, of this HASP/RPP.

Additional details regarding implementation of these tasks appear in other site-related documents such as the field sampling plan.

4.0 SITE-SPECIFIC HAZARD EVALUATION

Field activities and physical features of the site may expose field personnel to a variety of hazards. This section provides information on potential hazards related to site activities and the nature of hazardous materials. Potential radiological, chemical, and physical hazards related to site activities are discussed below.

4.1 SUMMARY OF EXISTING RADIOLOGICAL CONDITIONS

Based on historical information regarding uranium contamination throughout the site and isotopic uranium analysis of on-site soil, most uranium at the site likely is primarily in the form of natural uranium (U-nat). U-nat consists of three major isotopes, uranium-238 (U-238), uranium-235 (U-235), and uranium-234 (U-234). Although U-nat is composed primarily of U-238 (99.3 percent), the radioactivity percentage of each U-nat isotope is as follows: 48.9 percent U-238, 48.9 percent U-234, and 2.2 percent U-235. The nature and extent of radiological contamination at the site are discussed in Section 3.3 above. The maximum total uranium concentration detected in on-site soil was 3,670 pCi/g. Th-230 is a long-lived decay product of uranium-234 and has been detected up to 445 pCi/g in on-site soil.

Based on historical information regarding radium contamination throughout the site, most radium at the site likely is in the form of relatively insoluble radium sulfate (RaSO_4). Radium contamination throughout the site likely is primarily in the form of Ra-226. Radium-228 has not been detected above background concentrations at the site. The nature and extent of radiological contamination at the site are discussed in Section 3.3 above. The maximum Ra-226 concentration detected in on-site soil was 1,124 pCi/g.

The on-site surface soil sample with greatest concentration of uranium and radium also contained 75 pCi/g of thorium-234, 89 pCi/g of protactinium-234, 257 pCi/g of lead-214, 233 pCi/g of bismuth-214, 3.53 pCi/g of actinium-228, 6.38 pCi/g of bismuth-212, and 2.91 pCi/g of thallium-208.

Ra-226 is formed from the radioactive decay of uranium-238 and thorium-230. Ra-226 undergoes radioactive decay via alpha emission, and has a half-life of approximately 1,600 years (see Table 4-1 below). Radon-222 is a daughter product of Ra-226. Members of the radon decay chain transmute via alpha or beta emission, and in some cases emit gamma radiation.

Uranium is a naturally occurring element. In its natural state, crystal uranium occurs as a component of several minerals, such as carnotite, uraninite, and pitchblend, but is not found in the metallic state. U-238 undergoes radioactive decay via alpha and gamma emissions, and has a half-life of approximately 4,468,000,000 years (see Table 4-1). U-234 undergoes radioactive decay via alpha and gamma emissions, and has a half-life of

approximately 245,500 years (see Table 4-1). U-235 undergoes radioactive decay via alpha and gamma emissions, and has a half-life of approximately 703,800,000 years (see Table 4-1).

**TABLE 4-1
RADIOACTIVE DECAY SERIES
CARNOTITE SITE**

Symbol	Element	Radiation	Half-Life	Decay Product
U-238	Uranium-238	Alpha	4,468,000,000 years	Th-234
Th-234	Thorium-234	Beta	24.1 days	Pa-234
Pa-234	Protactinium-234	Beta	1.17 minutes	U-234
U-234	Uranium-234	Alpha	245,500 years	Th-230
Th-230	Thorium-230	Alpha	80,000 years	Ra-226
Ra-226	Radium-226	Alpha	1,600 years	Rn-222
Rn-222	Radon-222	Alpha	3.82 days	Po-218
Po-218	Polonium-218	Alpha	3.05 minutes	Pb-214
Pb-214	Lead-214	Beta	27 minutes	Bi-214
Bi-214	Bismuth-214	Beta	19.7 minutes	Po-214
Po-214	Polonium-214	Alpha	1 microsecond	Pb-210
Pb-210	Lead-210	Beta	22.3 years	Bi-210
Bi-210	Bismuth-210	Beta	5.01 days	Po-210
Po-210	Polonium-210	Alpha	138.4 days	Pb-206
Pb-206	Lead-206	None	stable	(none)

4.2 WORKER/PUBLIC RADIATION DOSE LIMITS

Site investigation activities may pose increased potential for worker and public exposures to disturbed radioactive materials via a variety of potential exposure pathways. These pathways include inhalation of suspended particulates and/or radon progeny, direct exposure to gamma emitting radioactive material, and ingestion or inhalation of removable contamination. The HASP/RPP is implemented by application of selected components, including dose limits, of the radiological protection framework presented within Title 32 of IAC. Use of these dose limits (subject to administrative reductions and monitoring/radiological protection actions) will ensure that worker doses are documented, and that public and worker doses are maintained at levels As Low as Reasonably Achievable (ALARA).

The ALARA concept serves as the basis for a sound health physics program. On-going evaluation of site procedures is an important aspect of the ALARA program. Radioactive materials license conditions and applicable regulations dictate the maximum limits for levels of contamination, airborne particulates, and personnel dose. However, an effective ALARA program sets administrative goals that are more restrictive in order to reduce exposures and force an evaluation of procedures and other site controls, if needed.

The ALARA policy will be implemented as part of the site HASP/RPP via site safety meetings, training, planning, issuance of and compliance with SWPs, implementation of radiation control measures, establishment of administrative control limits, and use of PPE. Implementation of the policy requires active participation of all on-site personnel and anyone entering the site, especially all personnel conducting work within established exclusion zones. Engineering controls will be the preferred means of reducing exposures, although administrative control or personal protective clothing and equipment may also be used.

Specific information on potential radiological hazards at the site is in Table 4-2, including exposure limits, anticipated exposure routes, and toxic characteristics. Table 4-3 lists radiation dose limits per year and the project-administered radiation dose limits.

TABLE 4-2
POTENTIAL RADIOLOGICAL HAZARDS
CARNOTITE SITE

Radiological Contaminant	Exposure Limits	Exposure Routes	Toxic Characteristics⁽¹⁾
Radium-226	See Table 4-3	Inhalation of suspended particulates and radon progeny, direct exposure to gamma-emitting radium sources, and ingestion or inhalation of removable alpha contamination	Long-term exposure to low levels of radium increases risk of developing several types of diseases. Inhaled or ingested radium increases risk of developing lymphoma, bone cancer, and diseases that affect formation of blood, such as leukemia and aplastic anemia. These effects usually take years to develop. External exposure to radium's gamma radiation increases risk of cancer to varying degrees in all tissues and organs.
Thorium-230	See Table 4-3	Inhalation of suspended particulates, direct exposure to gamma-emitting sources, and ingestion or inhalation of removable alpha contamination	Inhaled or ingested thorium may cause an increased risk of developing lung or bone cancer.
Uranium (nat)	See Table 4-3	Inhalation of suspended particulates, direct exposure to gamma-emitting sources, and ingestion or inhalation of removable alpha contamination	Intakes of uranium exceeding EPA standards can lead to increased cancer risk, liver damage, or both. Long-term chronic intakes of uranium isotopes in food, water, or air can lead to internal irradiation and/or chemical toxicity.

TABLE 4-3
ENVIRONMENTAL MONITORING DOSE LIMITS FOR WORKERS AND PUBLIC
CARNOTITE SITE

Dose Target	32 IAC Part 340	Project Administrative Limits⁽¹⁾
Worker Whole Body TEDE ⁽²⁾	5 rem/year	External Dose 0.125 rem/quarter (0.500 rem/year) Internal Dose 0.125 rem/quarter (0.500 rem/year)
Worker Lens of Eye	15 rem/year	0.375 rem/quarter (1.5 rem/year) ⁽³⁾
Worker Individual Organ	50 rem/year	1.25 rem/quarter (5 rem/year)
Worker Skin or Extremity	50 rem/year	1.25 rem/quarter (5 rem/year) ⁽³⁾
Public Whole Body TEDE ⁽²⁾	0.1 rem/year	0.1 rem/year

Notes:

⁽¹⁾ Project administrative limits are ALARA goals and 10% of annual limits based on 32 IAC 340.520. These are presented on a quarterly basis because data will be acquired quarterly.

⁽²⁾ TEDE is calculated as the sum of the external dose equivalent and the committed effective dose equivalent.

⁽³⁾ It is anticipated that lens of eye and skin/extremity doses will be negligible; therefore, no formal monitoring protocols are specified. Should field conditions warrant, additional monitoring will occur.

IAC *Illinois Administrative Code*
mrem Millirem
rem Roentgen equivalent man
TEDE Total effective dose equivalent

4.3 CHEMICAL HAZARDS

Previous investigations have identified 10 non-radiological contaminants of potential concern at the Carnotite site: arsenic, benzo(a)anthracene, benzo (b)fluoranthene, benzo(a)pyrene, carbazole, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, lead, mercury, and naphthalene. Arsenic was detected in soil at concentrations up to 60 mg/kg. Benzo(a)anthracene was detected in soil up to 56.2 mg/kg. Benzo (b)fluoranthene was detected in soil up to 65.3 mg/kg. Benzo(a)pyrene was detected in soil up to 81.6 mg/kg. Carbazole was detected in soil up to 4.59 mg/kg. Dibenz(a,h)anthracene was detected in soil up to 6.84 mg/kg. Indeno(1,2,3-cd)pyrene was detected in soil up to 127 mg/kg. Lead was detected in soil up to 7,400 mg/kg. Mercury was detected in soil up to 1.7 mg/kg. Naphthalene was detected in soil up to 148 mg/kg. The Engineer will limit exposure to these potential chemical hazards by implementation of engineering controls such as suppression, and administrative controls such as limitation of access to areas of contamination. Site action levels for particulate monitoring in air should be inclusive and sufficiently protective for these chemical hazards as well as the radiological hazards on-site.

Also, the Engineer will limit exposure to chemical hazards by requiring use of appropriate PPE such as Tyvek[®] coveralls, gloves, and overboots. See Section 6.1 for PPE requirements. Specific information on potential chemical hazards at the site appears in Table 4-4, including exposure limits, anticipated exposure routes, and toxic characteristics. SDSs included with this HASP/RPP summarize health and safety information regarding

hazardous materials that will be brought to the site, such as laboratory reagents, decontamination solutions, and sample preservatives.

Additionally, Agency for Toxic Substances and Disease Registry (ATSDR) fact sheets are included for arsenic, lead, mercury, naphthalene, polycyclic aromatic hydrocarbons (PAH) (i.e., benzo(a)anthracene, benzo(b)fluoranthene, benzo(a)pyrene, carbazole, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene), radium, and uranium.

- Arsenic ATSDR fact sheet
- Lead ATSDR fact sheet
- Mercury ATSDR fact sheet
- Naphthalene ATSDR fact sheet
- PAH ATSDR fact sheet
- Radium ATSDR fact sheet
- Thorium ATSDR fact sheet
- Uranium ATSDR fact sheet.

All site personnel will be informed of hazards associated with the contaminants of concern and any chemicals necessary to complete the project. Additionally, SDSs will be included as needed and provided with the HASP/RPP or brought to the site.

TABLE 4-4
POTENTIAL CHEMICAL HAZARDS
CARNOTITE SITE

Chemical	Matrix	Highest Observed Concentration	Exposure Limits and IDLH Level	Exposure Routes	Symptoms of Exposure
Arsenic	Soil	60 mg/kg	PEL = TWA 0.01 mg/m ³ REL = CARC = 0.002 mg/m ³ [15-minute] TLV = TWA 0.01 mg/m ³ IDLH = CARC; 5.0 mg/m ³	Inhalation, ingestion, skin and/or eye contact	Ulceration of nasal septum, dermatitis, gastrointestinal disturbances, peripheral neuropathy, respiratory irritation, hyperpigmentation of skin, potential occupational carcinogen
Lead	Soil	7,400 mg/kg	PEL = TWA 0.05 mg/m ³ REL = CARC = 0.05 mg/m ³ TLV = TWA 0.05 mg/m ³ IDLH = 100 mg/m ³	Inhalation, ingestion, skin and/or eye contact	Lassitude (weakness, exhaustion), insomnia; facial pallor; anorexia, weight loss, malnutrition; constipation, abdominal pain, colic; anemia; gingival lead line; tremor; paralysis wrist, ankles; encephalopathy; kidney disease; irritation eyes; hypertension
Mercury	Soil	1.7 mg/kg	PEL = TWA 0.1 mg/m ³ REL = CARC = 0.1 mg/m ³ TLV = TWA 0.05 mg/m ³ IDLH = 10 mg/m ³	Inhalation, skin absorption, ingestion, skin and/or eye contact	Irritation eyes, skin; cough, chest pain, dyspnea (breathing difficulty), bronchitis, pneumonitis; tremor, insomnia, irritability, indecision, headache, lassitude (weakness, exhaustion); stomatitis, salivation; gastrointestinal disturbance, anorexia, weight loss; proteinuria
Naphthalene	Soil	148 mg/kg	PEL = TWA 10 ppm or 50 mg/m ³ REL TLV = TWA 10 ppm or 50 mg/m ³ IDLH = 250 ppm	Inhalation, skin absorption, ingestion, skin and/or eye contact	Irritation eyes; headache, confusion, excitement, malaise (vague feeling of discomfort); nausea, vomiting, abdominal pain; irritation bladder; profuse sweating; jaundice; hematuria (blood in the urine), renal shutdown; dermatitis, optical neuritis, corneal damage
PAHs (as Coal Tar Pitch Volatiles)	Soil	127 mg/kg of Indeno(1,2,3-cd)pyrene	PEL = TWA 0.2 mg/m ³ REL = CARC = TWA 0.1 mg/m ³ TLV = TWA 0.2 mg/m ³ IDLH = 80 mg/m ³ PEL = TWA 100 ppm (Naphtha [coal tar])	Inhalation, skin absorption, ingestion, skin and/or eye contact	Headache, nausea, vomiting, diaphoresis, respiratory and dermal irritation; chronic bronchitis, chronic cough irritation, bronchogenic cancer, dermatitis, cutaneous photosensitization, pilosebaceous reactions, leukoplakia, buccal-pharyngeal cancer, cancer of the lip, lymphoma, hematuria, kidney and bladder cancers

4.4 PHYSICAL HAZARDS

Physical hazards associated with site activities present a potential threat to on-site personnel. Dangers are posed by, but not limited to, heavy equipment, open excavations, utility and power lines, slippery surfaces, unseen obstacles, noise, heat, cold, and poor illumination.

Injuries resulting from physical hazards can be avoided by applying SWP and exercising caution when working with machinery. Specific SWPs applicable to the site are listed in Section 9.5. To ensure a safe workplace, the SSC will conduct and document regular safety inspections, and will ensure that all of the Engineer's workers and visitors are informed of any potential physical hazards related to the site.

Physical hazards that have been identified at this site include the following:

- Exposure to radiological hazard from radium, uranium, and thorium
- Slips, trips, and falls
- Heavy machinery
- Open excavations
- Truck traffic
- Airborne dust and flying debris
- High noise
-
- Weather extremes including heat and cold stress
- Heavy lifting

4.5 BIOLOGICAL HAZARDS

The site is within a minimally wooded and mostly open area. Encountering biological hazards, primarily biting and stinging insects, is possible during work activities.

Table 4-5 presents a hazard analysis that encompasses chemical, physical, and biological hazards, including required controls regarding drilling to occur at the site.

4.6 ACTIVITY HAZARD ASSESSMENT

Multiple work tasks will be undertaken during the site remediation activities. These work tasks will require participation of various project staff and subcontractors, and may involve varying potential for exposure to chemical, physical, biological, and radiological hazards at the site. Table 4-5 includes descriptions of primary monitoring and investigation work tasks and their associated chemical, physical,

biological, and radiological hazards. Also included are mitigation measures to reduce or control impacts of the chemical, physical, biological, and radiological hazards. Many radiological hazard mitigation measures are actions described in the radiological safe work practices to be developed by the Engineer. Other actions are developed based on task-specific circumstances. Table 4-5 presents a hazard analysis that encompasses chemical, physical, biological, and radiological hazards at the site.

TABLE 4-5
RADIOLOGICAL, CHEMICAL, PHYSICAL, AND BIOLOGICAL HAZARD ANALYSIS
CARNOTITE SITE

Task	Potential Hazard	Controls	Initial Level of Protection	Upgraded Level of Protection
Soil Excavation	Radiological hazards: radium-226, uranium-234, 235, 238, and thorium-230 in soil. Exposure through respirable particulates in air or direct contact; Potential worker and equipment contact and contamination during excavation activities; Inadvertent spread of radium-226, uranium-234, 235, 238, and thorium-230 contamination to site and environments. Exposure to chemicals listed in Table 4-4 through respirable particulates in air or direct contact; Underground utilities; Open excavations and / or trenches; Heavy equipment; High noise; Heat and/or cold stress; Sun exposure; Uneven, muddy, or rugged terrain; General slips, trips, and falls; Heavy lifting; Biohazards, including poisonous plants and biting and stinging insects	Monitor airborne dust and initiate dust control in accordance with this HASP/RPP, Use appropriate safe work practices for field work, HAZWOPER, and Trenching and Excavation Safety, Fall protection practices, Heat and/or cold stress, Sun exposure, Safe lifting practices; Working near heavy equipment, Hearing Conservation Program, Biohazards, and Respirator cleaning and use of air purifying respirators. Radiation Worker Training Requirements, Work Area Gamma Exposure Rate Surveys, Portable Radiation Equipment Function Check and Operation, Surveys for Surface Contamination and Release of Equipment for Unrestricted Use, Personnel Frisking Surveys, and Decontamination of Personnel and Equipment.	Level D ensemble: Clothing: work uniform or coveralls, safety glasses. Respirator: N/A Gloves: Leather work or nitrile as needed Boots: leather steel toe/steel shank Other: hardhat, high-visibility vest, ear plugs (near heavy equipment or in high noise areas), sunscreen, and insect repellant, as needed	Level C ensemble: Respirator: full-face air purifying respirator with appropriate P100 cartridge Tyvek QC or SL as needed to avoid contamination If personnel do not have a respirator, personnel must leave area until H&S concern subsides

TABLE 4-5 (CONTINUED)
RADIOLOGICAL, CHEMICAL, PHYSICAL, BIOLOGICAL, AND RADIOLOGICAL HAZARD ANALYSIS

Task	Potential Hazard	Controls	Initial Level of Protection	Upgraded Level of Protection
Radiological screening of soil and soil sampling	Radiological hazards: radium-226, uranium-234, 235, 238, and thorium-230 in soil. Exposure through respirable particulates in air or direct contact; Potential worker and equipment contact and contamination during screening activities; Inadvertent spread of radium-226, uranium-234, 235, 238, and thorium-230 contamination to site and environments; Exposure to chemicals listed in Table 4-4 through respirable particulates in air or direct contact; Underground utilities; Open excavations and / or trenches; Heavy equipment; High noise; Heat or cold stress; Sun exposure; Uneven, muddy, or rugged terrain; General slips, trips, and falls; Heavy lifting; Biohazards, including poisonous plants and biting and stinging insects	Monitor airborne dust and initiate dust control in accordance with this HASP/RPP, Use appropriate safe work practices for field work, HAZWOPER, and Trenching and Excavation Safety. The remediation contractor will conduct an aboveground and underground utility clearance before mobilization. The remediation contractor will provide a Competent Person to oversee all excavation in accordance with 29 CFR §1926.651, including inspection requirements. NO PERSON will enter an open excavation without appropriate excavation sloping or earth retention system in place. Fall protection practices, Heat and/or cold stress, Sun exposure, Safe lifting practices; Working near heavy equipment, Hearing Conservation Program, Biohazards, and Respirator cleaning and use of air purifying respirators. Radiation Worker Training Requirements, Portable Radiation Equipment Function Check and Operation, Personnel Frisking Surveys, and Decontamination of Personnel and Equipment.	Level D ensemble: Clothing: work uniform or coveralls, safety glasses. Eye and Face: Safety glasses Respirator: N/A Gloves: Leather work or nitrile as needed Boots: leather steel toe/steel shank Other: hardhat, high-visibility vest, ear plugs (near heavy equipment or in high noise areas), sunscreen, and insect repellent, as needed	Level C ensemble: Respirator: full-face air purifying respirator with appropriate P100 cartridge Tyvek QC or SL as needed to avoid contamination If personnel do not have a respirator, personnel must leave area until H&S concern subsides

Notes:

HAZWOPER Hazardous Waste Operations and Emergency Response
N/A Not applicable

5.0 TRAINING REQUIREMENTS

All on-site personnel who may be exposed to hazardous conditions, including Engineer and their subcontractor personnel and site visitors who will participate in on-site activities, will be required to meet training requirements outlined in 29 CFR Part 1910.120, “Hazardous Waste Operations and Emergency Response.” All Engineer personnel and visitors who could encounter or handle contaminated soil or groundwater at the site will be required to review this HASP/RPP and sign the Compliance Agreement form, and the Engineer’s site workers and direct subcontractors will be required to sign a Daily Tailgate Safety Meeting form.

Before on-site activities begin, the Engineer’s RSO will present a briefing specifically on radiation hazards associated with the site for all personnel who participate in on-site activities. This includes the Engineer’s personnel, Engineer’s subcontracted personnel, the remediation contractor’s personnel, and the remediation subcontractor’s personnel. The following topics will be addressed during the radiation safety training:

- Basic Radiation Physics
- Sources of Radiation
- ALARA Principle (Time, Distance, Shielding)
- Radiation Units and Quantities
- Radiation Biology
- Personnel Monitoring
- Air and Soil Monitoring
- Working Safely Around Radiation
- Site Control Zones
- Applicable Regulations and Instructions to Workers.

In addition to the Engineer’s RSO training, the Engineer’s SSC will present a briefing for all personnel who will participate in on-site activities. The following topics will be addressed during the pre-work briefing:

- Names of the SSC and the designated alternate
- Site history
- Work tasks
- Hazardous chemicals that may be encountered on site
- Physical hazards that may be encountered on site

- PPE, including type or types of respiratory protection to be used for work tasks
- Training requirements
- Environmental surveillance (air monitoring) equipment use and maintenance
- Action levels and situations requiring upgrade or downgrade of level of protection
- Site control measures, including site communications, control zones, and SWPs
- Decontamination procedures
- Emergency communication signals and codes
- Environmental accident emergency procedures (in case contamination spreads outside the exclusion zone)
- Personnel exposure and accident emergency procedures (in case of falls, exposure to hazardous substances, and other hazardous situations)
- Fire and explosion emergency procedures
- Emergency telephone numbers
- Emergency routes.

Worker training requirements specific to the radiation concern are discussed further in the Engineer's radiation SWPs. Any other health and safety-related issues that may arise before on-site activities begin will also be discussed during the pre-work briefing.

Additionally, the remediation contractor personnel serving as the trenching and excavation competent person will have training and experience necessary to fulfill the requirements of that position in accordance with 29 CFR §1926.651.

The daily tailgate safety meetings will encompass relevant safety topics for the day's scope of work. The daily tailgate safety meeting will be led by the Engineer's SSC and RSO in close coordination with AIS's remediation contractor's competent person and RSO. Issues that arise during implementation of on-site activities will be addressed during tailgate safety meetings to be held daily before the workday or shift begins, and will be documented in the Daily Tailgate Safety Meeting form. Any minor changes in procedures or site-specific health and safety-related matters will be addressed during these meetings. Significant plan revisions or procedure changes must be reviewed and approved by the Engineer's HSR, and discussed with the PM. Following approval these changes will be relayed to Engineer's and their subcontractor personnel by the Engineer's SSC.

6.0 PERSONAL PROTECTION REQUIREMENTS

The levels of personal protection to be used for Engineer work tasks at the site have been selected based on known or anticipated physical hazards; types and concentrations of contaminants that may be encountered on site; and contaminant properties, toxicity, exposure routes, and matrixes. The following sections describe protective equipment and clothing; reassessment of protection levels; limitations of protective clothing; and respirator selection, use, and maintenance.

6.1 PROTECTIVE EQUIPMENT AND CLOTHING

Engineer personnel will wear protective equipment when (1) site activities involve known or suspected atmospheric contamination; (2) site activities may generate vapors, gases, or particulates; or (3) direct contact with hazardous materials may occur. Based on the anticipated hazard level, personnel will initially perform field tasks in Level D protection. If site conditions or results of air monitoring during on-site activities warrant a higher level of protection, all field personnel will withdraw from the site, immediately notify the Engineer's SSC, and wait for further instructions. Descriptions of equipment and clothing required for Level D and Level C protection are as follows:

- Level D
 - Coveralls or work clothes, if applicable
 - Class II or better, high-visibility safety vests
 - Outer gloves (neoprene, nitrile, or other), if applicable
 - Disposable inner gloves (such as latex or vinyl)(optional)
 - Boots with steel-toe protection and steel shanks
 - Disposable boot covers or chemical-resistant outer boots
 - Safety glasses or goggles
 - Hard hat (face shield optional)
 - Hearing protection (for areas with a noise level exceeding 85 decibels on the A-weighted scale)
- Level C
 - Coveralls or work clothes, if applicable
 - Chemical-resistant clothing (such as Tyvek® or Saranex® coveralls)
 - Class II or better, high-visibility safety vests
 - Outer gloves (neoprene, nitrile, or other), if applicable
 - Disposable inner gloves (latex or vinyl)
 - Boots with steel-toe protection and steel shanks
 - Disposable boot covers or chemical-resistant outer boots

- Full- or half-face, air-purifying respirator with National Institute for Occupational Safety and Health (NIOSH)-approved cartridges to protect against organic vapors, dust, fumes, and mists
- Safety glasses or goggles (with a half-face respirator only)
- Hard hat (face shield optional)
- Hearing protection (for areas with a noise level exceeding 85 decibels on the A-weighted scale)

6.2 REASSESSMENT OF PROTECTION LEVELS

PPE levels may be downgraded based on a change in site conditions or investigation findings, and only after approval by the Engineer's HSR. When a significant change in site conditions occurs, hazards will be reassessed. Some indicators of need for reassessment are as follows:

- Commencement of a new work phase, such as the start of a significantly different activity or work that begins on a different portion of the site.
- A change in job tasks during a work phase.
- A change of season or weather.
- Temperature extremes or individual medical considerations limiting effectiveness of PPE.
- Discovery of contaminants other than those previously identified.
- A change in ambient levels of airborne contaminants (see the radiological monitoring action levels listed in Table 8-1).
- A change in work scope that affects the degree of contact with contaminated media.

6.3 LIMITATIONS OF PROTECTIVE CLOTHING

PPE clothing ensembles designated for use during site activities have been selected to provide protection against contaminants at known or anticipated on-site concentrations and physical states. However, no protective garment, glove, or boot is entirely chemical-resistant; nor does any protective clothing provide protection against all types of chemicals. Permeation of a given chemical through PPE depends on the contaminant concentration, environmental conditions, physical condition of the protective garment, and resistance of the garment to the specific contaminant. Chemical permeation may continue even after the source of contamination has been removed from the garment.

All site personnel will follow the procedures below to achieve optimum performance from PPE:

- When chemical-protective coveralls become contaminated, don a new, clean garment after each rest break or at the beginning of each shift.
- Inspect all clothing, gloves, and boots both before and during use for the following:

- Imperfect seams
- Non-uniform coatings
- Tears or cracks
- Poorly functioning closures
- Inspect reusable garments, boots, and gloves both before and during use for visible signs of chemical permeation, such as the following:
 - Swelling
 - Discoloration
 - Stiffness
 - Brittleness
 - Cracks
 - Any sign of puncture
 - Any sign of abrasion.

Reusable gloves, boots, or coveralls exhibiting any of the characteristics listed above must be discarded. Reusable PPE will be decontaminated in accordance with procedures described in Section 10.0, and will be neatly stored in the support zone away from work zones.

6.4 RESPIRATOR SELECTION, USE, AND MAINTENANCE

The Engineer and their subcontractor personnel will be informed of proper use, maintenance, and limitations of respirators during annual health and safety refresher training and the pre-work briefing. Any on-site personnel who will use a tight-fitting respirator must pass a qualitative fit test for the respirator that follows the fit testing protocol provided in Appendix A to the OSHA respirator standard and applicable IEMA requirements (29 CFR Part 1910.134 and 32 IAC 340.730). Fit testing must be repeated annually or when a new type of respirator is used.

Respirator selection is based on assessment of the nature and extent of hazardous atmospheres anticipated during field activities. This assessment includes a reasonable estimate of employee exposure to respiratory hazards and identification of each contaminant's anticipated chemical form and physical state.

Each site-specific HASP/RPP must include a Respiratory Hazard Assessment to determine appropriate respiratory protection. Approved respirators for protection against particulate contaminants can include the following:

- An atmosphere supplying respirator

- A respirator equipped with a filter certified by NIOSH under 32 CFR Part 11 or 42 CFR Part 84 as a P100 filter (formerly known as a high-efficiency particulate air [HEPA] filter).

For any tasks performed in Level C PPE, a full-face, air-purifying respirator equipped with NIOSH-approved cartridges or filters will be selected to protect against radiological hazards, vapors, gases, and aerosols. Air-purifying respirators will be used only in conjunction with real-time, breathing-space air monitoring, which must comply with the action levels listed in Table 8-1. Air-purifying respirators will be used only when they can provide protection against the substances encountered on site. Details regarding the use, cleaning, and maintenance of respirators are to be described in relevant safe work procedures included in each site-specific HASP/RPP.

7.0 MEDICAL SURVEILLANCE

The following sections describe the Engineer's medical surveillance program, including health monitoring requirements, site-specific medical monitoring, and medical support and follow-up requirements. Procedures documented in these sections will be followed for all Engineer activities at the site. Additional requirements are specified in the Engineer's *Health and Safety Manual*.

7.1 HEALTH MONITORING REQUIREMENTS

All Engineer and their subcontractor personnel involved in on-site activities at the site must participate in a health monitoring program as required by 29 CFR Part 1910.120(f). Under this program, the Engineer's personnel receive baseline and annual or biennial physical examinations consisting of the following:

- Complete medical and work history
- Physical examination
- Vision screening
- Audiometric screening
- Pulmonary function test
- Resting electrocardiogram
- Chest X-ray (required once every 3 years)
- Blood chemistry, including hematology and serum
- Urinalysis.

For each Engineer employee, the Engineer receives a copy of the examining physician's written opinion after post-examination laboratory tests have been completed; the Engineer's employee also receives a copy of the written opinion. This opinion includes the following information (in accordance with 29 CFR Part 1910.120[f][7]):

- Results of the medical examination and tests.
- The physician's opinion as to whether the employee has any medical conditions that would place the employee at an increased risk of health impairment from work involving hazardous waste operations or during an emergency response.
- The physician's recommended limitations, if any, on the employee's assigned work; special emphasis is placed on fitness for duty, including the ability to wear any required PPE under conditions expected on site (for example, temperature extremes).
- A statement that the employee has been informed by the physician of the medical examination results and of any medical conditions that require further examination or treatment.

Engineer personnel working at the site will also be subject to medical surveillance requirements.

All personnel on-site must have health monitoring programs conducted by their respective employer designated clinics in compliance with 29 CFR §1910.120(f). Any frequent visitor or observer at the site will be required to provide records in compliance with 29 CFR Part 1910.120(f) before he or she can enter the site.

Infrequent visitors or observers will be briefed on radiation hazards and other health hazards as well as site specific procedures. The Engineer will verify any visitors or observers have appropriate PPE prior to entering the site. Infrequent visitors or observers will be escorted the entire duration that they are in the exclusion zone by the Engineer's RSO or the Engineer's RSO's designee.

7.2 SITE-SPECIFIC MEDICAL MONITORING

Before Engineer personnel and their subcontractors who will wear respirators can enter the Exclusion Zone or contamination reduction zone (CRZ) at the site, they must undergo a qualitative respirator fit test (see Section 9.0, Site Control).

7.3 MEDICAL SUPPORT AND FOLLOW-UP REQUIREMENTS

As a follow-up to an injury requiring care beyond basic first aid or to possible exposure above established radiation exposure limits, all Engineer employees are entitled to and encouraged to seek medical attention and physical testing. Such injuries and exposures must be reported to the Engineer's SSC and HSR. Depending on the type of injury or exposure, follow-up testing, if required, must be performed within 24 to 48 hours of the incident. The Engineer's medical consultant will be responsible to advise regarding the type of test required to accurately monitor for exposure effects. An incident report must be completed by the Engineer's PM in the event of an accident, illness, or injury. A copy of this must be forwarded to the Engineer's HSR for use in determining the recordability of the incident and for inclusion in the Engineer's medical surveillance records.

8.0 ENVIRONMENTAL MONITORING AND SAMPLING

Environmental monitoring or sampling will occur to assess personnel exposure levels, as well as site or ambient conditions, and to determine appropriate levels of PPE for work tasks. Perimeter air monitoring will also be conducted by the Engineer and Engineer's RSO but those procedures are discussed in the FSP.

The following sections discuss initial and background air monitoring, personal monitoring, ambient air monitoring, monitoring parameters and devices, use and maintenance of survey equipment, thermal stress monitoring, and noise monitoring. Site-specific air monitoring requirements and action levels are listed in Table 8-1. Engineer SWPs and SOPs will be provided in the site-specific HASP/RPP, which will be prepared before remediation activities begin.

8.1 INITIAL AND BACKGROUND AIR MONITORING

Before a work task begins, initial and background air monitoring of the work area for Ra-226, uranium, and Th-230 will be completed at the site. Procedures for initial and background air monitoring are described in the FSP. This will be conducted by the Engineer and Engineer's RSO. The remediation contractor or remediation contractor's RSO may conduct initial and background air monitoring as appropriate.

Operations at the site may result in variable background levels of airborne compounds. Airborne compounds may be released from vehicles, blowing dust, material transfers, and so on. These sources can complicate evaluation of contaminant emissions during project tasks. Therefore, several upwind and pre-work measurements will be taken to assess contributions to airborne contamination by other potential sources. Additional information on initial and background air monitoring appears in the appropriate Engineer radiation SWP.

8.2 PERSONAL MONITORING

Employees working closest to a source of contamination have the highest likelihood of exposure to airborne contaminant concentrations that may exceed established exposure limits. Therefore, selective monitoring of the workers closest to a source of contaminant generation may be conducted during site activities. Personal monitoring will occur in the breathing zone, and, if a worker is wearing respiratory protective equipment, outside the face piece.

The Engineer and remediation contractor will conduct personal monitoring for their respective personnel separately.

8.3 AMBIENT AIR MONITORING

Most tasks will require monitoring of the general work area or ambient site conditions. Ambient monitoring will generally be conducted by use of direct-reading survey instrumentation, compound-specific instruments, or detector tubes. High-volume air particulate sampling will also be conducted in the work area by the Engineer's RSO.

Initial ambient air monitoring will be performed at the site. Periodic ambient air monitoring will also occur at the frequency listed in radiation SWP addressing air monitoring.

Dust monitoring will be conducted by the Engineer and occur at the excavation area by use of continuous, real-time, direct-read particulate monitors primarily for respirable dust particulates or Particulate Matter of 4 micrometers and smaller (PM₄). The aerosol monitors will run continuously each day during excavation activities, will be able to be moved throughout the site, and placed on adjustable tripods to breathing zone height. Site action levels for airborne particulate have been calculated based on levels of total and specific metals and Ra-226, uranium, and Th-230 in the soil. If site action levels are exceeded, work will be stopped, and dust suppression engineering controls, including wetting soil with water to immobilize dust, will be initiated.

8.4 MONITORING PARAMETERS AND DEVICES

The following sections describe use and limitations of instruments utilized to monitor for organic vapors, radiation, combustible atmospheres, percent oxygen, and particulates. Site-specific air monitoring requirements are discussed in the appropriate Engineer radiation SWP regarding air monitoring. Radiological monitoring devices are addressed in Engineer radiation SWPs addressing the functionality of portable radiation equipment.

All monitors will be calibrated in accordance with manufacturer recommendations prior to start of the project. Calibration requirements for radiological equipment are in radiation SWP regarding portable radiation equipment functionality, along with an instrument function check form to record calibration results.

8.4.1 Organic Vapors

PAHs have been identified at the site within subsurface soil samples. Air monitoring for organic vapors will be conducted during underground storage tank removal activities and may be conducted whenever subsurface activities occur, if odors are observed. Air monitoring for organic vapors will be conducted utilizing a photoionization detector (PID) such as a MiniRAE 3000 or similar. NIOSH-approved full-face respirator with organic vapor cartridges will be worn whenever total airborne hydrocarbon or VOC vapor levels in the breathing zone of field personnel reach or exceed a 15- minute average site specific action level of 11 ppm in summer and 25 ppm in winter. If total airborne hydrocarbons or VOC vapors in the breathing zone exceed an action level of 100 ppm (the OSHA PEL for Naptha [coal tar]), work will be suspended, personnel will be directed to move a safe distance from the source, and the operating unit health and safety manager or designee will be consulted in accordance with General Safe Work Practices for Oil and Petroleum Distillate Fuel Products.

8.4.2 Radiation

Ra-226, uranium, and Th-230 have been identified as the primary contaminants at the site. Table 8-1 lists radiation monitoring, action levels, and required steps if action levels are exceeded.

8.4.2.1 External Dosimetry

Based on previous site characterization data and current conditions, at no areas of the site surface are dose limits to individual members of the public specified in 32 IAC 340.310 likely exceeded. During intrusive activities that may bring subsurface contamination to the surface, the work area will be surveyed for gamma activity. These direct measurements, along with previous data and associated calculations, will be used to ensure that potential radiation exposure to site personnel does not exceed 10 percent of the annual limits set forth in 32 IAC 340.210.

All personnel will be required to wear radiation exposure monitoring devices while working onsite. Policy for implementation of the exposure monitoring device (external dosimeter) will be developed by the Engineer's RSO for the Engineer's and subcontractor's personnel. The remediation contractor's designated RSO will be responsible for providing external dosimetry for the remediation contractor's and subcontractor's personnel.

TABLE 8-1
RADIOLOGICAL MONITORING ACTION LEVELS

Monitoring Activity	RSO Responsible for Implementation	Action Level	Required Action	Section
External gamma exposure rate monitoring	Engineer's RSO and remediation contractor's RSO for respective personnel	> 2.0 mrem per hour in any work area continuously occupied for more than 1 hour from 32 IAC 340.310	Reevaluate staging of personnel, identify source of elevated exposure rates	8.4.2.1
Work area and personal air particulate sampling ⁽¹⁾	Engineer's RSO and remediation contractor's RSO for respective personnel	Ra-226 Conc. > 3.00 E-11 µCi/mL; U-nat Conc. > 2.00E-12 µCi/mL; and Th-230 Conc. > 3.00 E-13µCi/mL from 32 IAC 340.230, which references 10 CFR 20 Appendix B	Implement engineered control measures or upgrade respiratory protection (Level C)	8.4.2.2 and 8.4.5
Monitoring of equipment leaving radiologically controlled area	Remediation contractor RSO with approval and oversight of the Engineer's RSO	Total Fixed Alpha > 1000 dpm/100 cm ² and Removable Alpha > 33 dpm/100 cm ² from 32 IAC 340 Appendix A	Implement equipment decontamination procedures and resurvey	10.2
Monitoring of personnel leaving radiologically controlled area	Engineer's RSO and remediation contractor's RSO for respective personnel	Measurable contamination above background	Implement personnel decontamination procedures and resurvey	10.1

Notes:

Radon action level includes radon progeny contribution.

CFR	<i>Code of Federal Regulations</i>
dpm/100cm ²	Disintegrations per minute per 100 square centimeters
IAC	<i>Illinois Administrative Code</i>
µCi/mL	MicroCuries per milliliter
mrem	Millirem

⁽¹⁾ The work area and personal air particulate sampling action levels are 10% of the occupational values listed in 10 CFR 20, Appendix B, Table 1.

Work area gamma surveys shall be conducted per the appropriate radiation SWP by use of Bicron MicroRem or similar piece of equipment as prescribed by the relevant radiation SWP during activities posing potential encounter with radiological contamination. Results of these surveys shall be used to demonstrate compliance with 32 IAC 340.520(a). The Engineer's PM and RSO shall also evaluate environmental monitoring results to determine if a change to this approach is warranted.

8.4.2.2 Internal Dosimetry

Based on previous site characterization data and planned environmental monitoring activities, no personnel are likely to receive, in 1 year, an intake exceeding 10 percent of the applicable annual limit on intake in Table 1, columns 1 and 2 of Appendix B to 10 CFR 20, which would trigger need for occupational radiological air monitoring in compliance with 32 IAC 340.520(b). However, the Engineer's RSO will still implement and conduct work area high-volume air sampling to evaluate potential occupational exposures to airborne radium, uranium, and thorium during excavation. This will be conducted as a best practice and out of an abundance of caution to ensure the safety of on-site personnel. Low-volume personal air sampling for individuals may also be utilized, as needed.

8.4.3 Combustible Atmospheres

Because of the nature of the work at the site, at no areas where the Engineer's employees are expected to be exposed to combustible atmospheres; thus, no air monitoring for combustible atmospheres will occur.

8.4.4 Percent Oxygen

Because of the nature of the work at the site, no areas exist where the Engineer's employees are expected to be exposed to oxygen-deficient atmospheres; thus, no air monitoring for percent oxygen will occur.

8.4.5 Particulates

Aerosols are a group of airborne materials that include particulates, fumes, mists, and smoke. Particulates are the primary aerosol of concern at the site. Particulate migration will be managed by implementation of a comprehensive dust control program, which includes dust suppression by wetting soil with water to immobilize dust.

8.4.5.1 Work Area Monitoring

Also, particulate concentrations at the work or excavation area will be measured by use of a TSI Incorporated desktop aerosol monitor DustTrak DRX model 8533 or similar with environmental enclosures`. Based on industrial hygiene calculations, the Engineer's action dust action level for the site

has been established at 0.75 milligrams per cubic meter (mg/m³) 15 percent of the OSHA permissible exposure limit for Particulates Not Otherwise Regulated). This dust action level calculation is provided as an example which was determined to be sufficiently protective for all airborne hazards on-site. AIS's remediation contractor will need to conduct their own industrial hygiene calculations to be provided with their site-specific HASP/RPP.

If the dust action level is reached, work will stop and dust control procedures will be implemented by AIS's remediation contractor. The Engineer and the Engineer's RSO designees will have work stoppage authority if action levels are reached or dust control procedures are deemed inadequate based on the site goal of zero visible dust.

The primary assessment of radiological exposure for personnel will be radiological work area monitoring by continuous high-volume work area sampling. This will be conducted during remediation activities to ensure no exposure to levels of radium, uranium, and thorium during excavation exceeding derived air concentrations (DACs) of Radionuclides for occupational exposure based upon those specified under NRC regulations 10 CFR, Part 20 Appendix B. Work area air samplers will be stationed adjacent to the area being excavated daily, with a minimum of one upwind and one downwind location. Additional locations may be added based on-site activities that involve the handling of potentially contaminated soils. Air samples will be collected continuously during all operations that involve disturbance of potentially contaminated soils. Samples will be collected with Staplex Model TFIA High Volume Air Samplers utilizing Staplex Model TFA810 ashless paper filters, or equivalent. Sampling media (air sample filters) will be collected and replaced daily at the conclusion of each workday and analyzed onsite for gross alpha. Air samples will be analyzed the next day and, if "day after" results exceed background, again after 4 days to allow short-lived daughter products to decay.

8.4.5.2 Personal Air Monitoring

Engineer and their subcontractor personnel radiological air monitoring with low volume personal air monitors (PAM) will be conducted as deemed necessary by the Engineer or Engineer's RSO based upon continuous high-volume work area sample results. If deemed necessary, selected workers participating in site activities that involve excavation, movement, or loading of potentially contaminated soils within a radiological exclusion zone will wear a PAM to evaluate the air quality in the worker's breathing zone. The Engineer's RSO or SSC may require that additional personnel wear PAMs if those workers could encounter airborne particulates during site operations. The Engineer's RSO or SSC may reduce the level of personnel air monitoring required if analysis demonstrates that on-site airborne radioactivity is significantly below the action level. Samples will be collected over the entire time a worker is inside the

exclusion zone, and the cumulative time will be recorded. Flow rate through air samples must remain between 2 and 4 liters per minute. Samples will be collected by use of Zefon Model 739 MCE Filter Cartridges – 37 millimeter x 0.8 micron membrane filters. Air sample filters will be collected and replaced daily, and submitted to the on-site field laboratory for analysis. Samples analyzed from the PAMs will be used to measure potential contributions to worker's dose from airborne radionuclides.

Table 8-1 above describes particulate monitoring activity, action levels, and required steps if action levels are exceeded. Particulate sampling procedures to be applied at the site are discussed in the FSP and presented in the radiation SWP addressing air monitoring.

8.5 USE AND MAINTENANCE OF SURVEY EQUIPMENT

All personnel using field survey equipment must have training in operation, limitations, and maintenance of that equipment. Maintenance and daily operational checks will accord with manufacturer recommendations, will be performed by individuals familiar with the devices, and at a minimum, will occur daily directly before and after use of these devices on site. Repairs, maintenance, and internal or electronic calibration of these devices will be recorded in an equipment maintenance logbook or in the equipment log sheet found in the appropriate radiation SWPs. The equipment maintenance logbook for each instrument will be kept in that instrument's case. Rented equipment will be repaired and maintained by the rental company. Results of routine calibration will be recorded on the equipment log sheets in the appropriate radiation SWPs. Procedures to conduct an operational checks of radiation equipment such as the Bicron MicroREM, and Ludlum Model 3 are also specified in the radiation SWPs regarding the operations and functionality of portable equipment.

Air monitoring equipment will be calibrated before work begins. If air monitoring with PAMs is deemed necessary, each PAM will be flow tested daily by use a flow calibration device (Buck™ primary flow calibrator or equivalent). Only basic maintenance (such as changing batteries) will be performed by on-site personnel. Any additional maintenance or repairs will be conducted by a trained service technician.

8.6 THERMAL STRESS MONITORING

Heat stress and cold stress are common and serious threats at hazardous waste sites. Engineer SWPs describe both heat and cold stress, and include monitoring methods appropriate for the season and location of work.

8.7 NOISE MONITORING

Most high noise levels at a work site are caused by equipment such as drill rigs or sources associated with the work site, such as equipment and vehicles. When noise levels at the site are suspected to equal or exceed an 8-hour time-weighted average (TWA) of 85 decibels on an A-weighted scale (85 dBA) in slow response mode, the Engineer's SSC will evaluate the work area to characterize the noise source and exposure levels. A sound level meter may be used for the evaluation, but a noise dosimeter is recommended for documenting full-shift noise exposures for Engineer personnel and their subcontractors. If neither instrument is available, the SSC may use a simple rule-of-thumb test to determine whether noise levels exceed 85 dBA. The test requires the SSC to determine how loud he or she must speak to be heard at an arm's length from another person. If the SSC must raise his or her voice to be heard, the average noise level likely exceeds 85 dBA.

Hearing protection must be worn if Engineer employees are exposed to noise levels that exceed the action level of 85 dBA. The protectors will be ear plugs or muffs that must provide sufficient attenuation to limit noise exposure to less than 85 dBA. The SSC will supervise use of hearing protectors by Engineer personnel and their subcontractors at the work site as necessary.

9.0 SITE CONTROL

Site control is an essential component in HASP/RPP implementation. The following sections discuss the Engineer's measures and procedures for site control, such as on-site communications, site control zones, site access control, site safety inspections, and SWPs.

9.1 ON-SITE COMMUNICATIONS

Successful communication between field teams and personnel in the support zone is essential. In non-combustible atmospheres, the following communication systems will be available during site activities:

- Cellular telephones
- Compressed air horn.

Texting within the exclusion zone by all on-site personnel will be limited to texts regarding remediation activities and only as necessary. Any used gloves shall be replaced prior to texting and any texting should be done in a safe area away from moving equipment. This is both for awareness of moving equipment and for radiation contamination safety. In the event that a cell phone comes in contact with contaminated soil it should be surveyed out of the exclusion zone following outlined procedures for equipment and decontaminated as appropriate as discussed in Section 10.2.

The following hand signals will be used by Engineer site personnel in emergency situations, in combustible atmospheres, or when verbal communication is difficult:

Signal	Definition
Hands clutching throat	Out of air or cannot breathe
Hands on top of head	Need assistance
Thumbs up	Okay, I am all right, or I understand
Thumbs down	No or negative
Arms waving upright	Send backup support
Gripping partner's wrist	Exit area immediately

9.2 SITE CONTROL ZONES

On-site work areas will be divided into an exclusion zone, a CRZ, and a support zone to control spread of contamination and employee exposures to chemical and physical hazards. These on-site work areas or zones will be defined by the Engineer's RSO in coordination with the Engineer and the remediation contractor.

Access to the exclusion zone and CRZ will be restricted to authorized personnel. Any visitors to these areas must present proper identification and be authorized to be on site, and must meet training requirements for the site, including site-specific training. The Engineer's SSC and RSO will identify work areas that visitors or personnel are authorized to enter and will enforce site control measures.

The following sections describe the exclusion zone, the CRZ, and the support zone, as well as procedures to be followed within each. Locations of the site control zones may be adjusted in the field.

9.2.1 Zone 1: Exclusion Zone

An exclusion zone includes areas where contamination is either known or likely to be present or could cause harm to personnel because of work activity. The perimeter of the exclusion zone and an appropriate radius around work task areas will be demarcated by a physical barrier, such as barricade tape or traffic cones, to restrict access. A daily roster with the date of each person's entrance into the exclusion zone; the person's name, signature, and organization; and the time of entry and exit will be kept for all personnel working in the zone. Visitors will not be permitted to enter the exclusion zone without proper qualifications, equipment, and the Engineer's SSC and RSO authorization. Work tasks that require establishment of an exclusion zone include the following:

- Excavation activities
- On-site soil radiation screening
- Verification soil sampling
- Radiological waste transportation sampling

9.2.2 Zone 2: Contamination Reduction Zone

A formally established CRZ is required for the site. The CRZ will contain facilities to decontaminate personnel and portable equipment. Personnel and equipment decontamination procedures are described in Section 10.0. Visitors will not be permitted to enter the CRZ without proper qualifications and the Engineer's SSC and RSO authorization.

9.2.3 Zone 3: Support Zone

The support zone shall consist of any uncontaminated and nonhazardous part of the site. The support zone shall be situated in an area generally upwind of any exclusion zone. Site visitors not meeting training, medical surveillance, and PPE requirements must stay in the support zone.

9.3 SITE ACCESS CONTROL

Site access is restricted by a chain link fence. Accessibility to the remainder of the site is restricted by a chain-link fence. The site will be inaccessible to the public during excavation, and all heavy equipment will be kept inside the work zone of the site. Security personnel will be provided by the remediation contractor during non-work hours.

9.4 SITE SAFETY INSPECTIONS

Periodic site safety inspections will be conducted by the Engineer's SSC and RSO to ensure safe work areas and compliance with this HASP/RPP. Results of the formal site safety inspections will be recorded on a Field Audit Checklist.

9.5 SAFE WORK PRACTICES AND RADIATION SAFE WORK PRACTICES

Following is a list of various SWPs and health and safety programs developed by the Engineer that are applicable to the site and will be included with the Engineer's site-specific HASP/RPP:

- Hearing Conservation Program
- Hot Work Practices
- Haulage and Earth Moving
- Lead Protection Program
- General Safe Work Practices
- General Safe Work Practices HAZWOPER
- Safe Drilling Practices
- Special Site Hazards
- Safe Electrical Work Practices
- Fall Protection Practices
- Portable Ladder Safety
- Drum and Container Handling Practices
- Flammable Hazards and Ignition Sources
- Spill and Discharge Control Practices
- Heat Stress
- Cold Stress
- Biohazards
- Safe Lifting Procedures
- Oil and Petroleum Distillate Fuel Product Hazards
- Prevention of Sun Exposure
- Respirator Cleaning Practices
- Safe Use Practices for Use of Respirators
- Respirator Qualitative Fit Testing Procedures

Following is a list of site-specific radiation SWPs developed by the Engineer's RSO that are applicable to the site and will be included with the Engineer's site-specific HASP/RPP:

- Radiation Worker Training Requirements
- Site Access Control
- External Dosimetry
- Work Area Gamma Exposure Rate Surveys
- Clean Area Surveys
- Waste Management
- Internal Dose Calculations
- Portable Radiation Equipment Function Check
- Gamma Radiological Screening Surveys
- Air Monitoring
- Surveys for Surface Contamination and Release of Equipment for Unrestricted Use
- Personnel Frisking Surveys
- Decontamination of Personnel and Equipment
- Operation of the Ludlum 2929 Alpha/ Beta System

10.0 DECONTAMINATION

Decontamination is the process of removing or neutralizing contaminants on personnel or equipment. When properly conducted, decontamination procedures protect workers from contaminants that may have accumulated on PPE, tools, and other equipment. Proper decontamination also prevents transport of potentially harmful materials to uncontaminated areas. AIS's remediation contractor's RSO will be required to develop decontamination procedures for personnel and equipment, which must be included in the remediation contractor's site-specific HASP and RPP. The following personnel and equipment decontamination procedures are provided as examples.

10.1 PERSONNEL DECONTAMINATION

Personnel decontamination procedures will follow guidance in the *Occupational Safety and Health Guidance Manual for Hazardous Waste Site Activities* (NIOSH and others 1985), the applicable radiation SWP and, if wet decontamination techniques are conducted, the Engineer's applicable SOPs. Before personnel leave the site, each person whose work activities involve potential contact with contamination will be screened in accordance with the radiation SWP regarding personnel and equipment decontamination. If contamination is found, personnel and PPE will be decontaminated using dry decontamination techniques and, if necessary, with potable water or a mixture of detergent and water. Liquid and solid wastes generated during decontamination will be collected and disposed of with other contaminated waste. Decontamination of personnel will follow the procedures defined in the aforementioned decontamination radiation SWP and, if applicable, the Engineer's general equipment decontamination SOP.

Used, disposable PPE, including respirator cartridges, will be collected in sealable containers and will be disposed of in accordance with procedures described in the FSP. Personnel decontamination procedures may be modified as necessary while on site. Compliance with site decontamination procedures for all personnel will be enforced by the Engineer's SSC and RSO.

10.2 EQUIPMENT DECONTAMINATION

Decontamination of all sampling and field monitoring equipment used during site activities will be required. Decontamination of sampling and monitoring equipment will follow the procedures defined in the previously mentioned radiation SWP regarding surveys for surface contamination and, if wet decontamination techniques are conducted, the Engineer's applicable SOP. Compliance with site decontamination procedures for all equipment will be enforced by the Engineer's SSC and RSO. Before

equipment is approved to be released for unrestricted use, each item will be screened in accordance with the applicable radiation SWP. The Engineer's RSO is the only personnel on-site with the authority to approve the release of any equipment for unrestricted use.

10.2.1 Sampling Equipment

Decontamination of sampling equipment, such as spoons and bowls, will be required. Non-disposable equipment will be decontaminated in accordance with radiation SWP detailing decontamination of personnel and equipment and, if wet decontamination techniques are conducted, the Engineer's SOP regarding general decontamination.

10.3 OTHER FIELD MONITORING EQUIPMENT

Any other equipment used in the exclusion or contamination reduction zone will be decontaminated following the procedures outlined in radiation SWP detailing decontamination of personnel and equipment and, if wet decontamination techniques are conducted, the Engineer's SOP regarding general decontamination.

11.0 EMERGENCY RESPONSE PLANNING

This section describes emergency response planning procedures to be implemented for the site consistent with local, state, and federal disaster and emergency management plans, and designed to comply with applicable provisions of 29 CFR §1910.38. The following sections discuss pre-emergency planning, personnel roles and lines of authority, emergency recognition and prevention, evacuation routes and procedures, emergency contacts and notifications, hospital route directions, emergency medical treatment procedures, protective equipment failure, fire or explosion, weather-related emergencies, spills or leaks, emergency equipment and facilities, and reporting.

11.1 PRE-EMERGENCY PLANNING

Before operations begin on site, the Field Team Leader will perform a dry run to the hospital listed in this HASP/RPP to ensure the route is correct. Additionally, the PM or Field Team Leader will determine whether the hospital has capability of managing radiologically-contaminated patients.

During the pre-work briefing and daily tailgate safety meetings, all on-site employees will be trained in and reminded of the provisions of Section 11.0, site communication systems, and site evacuation routes. The emergency response provisions will be reviewed on a regular basis by the Engineer's SSC, and will be revised, if necessary, to ensure that they are adequate and consistent with prevailing site conditions.

11.2 PERSONNEL ROLES AND LINES OF AUTHORITY

The Engineer's SSC has primary responsibility for responding to and correcting emergencies, and for taking appropriate measures to ensure the safety of site personnel and the public. Possible actions may include evacuation of personnel from the site area. The SSC is also responsible for ensuring that corrective measures have been implemented, appropriate authorities have been notified, and follow-up reports have been completed.

In addition to internally required emergency communications, in the event of an emergency pertaining to work at the site, the Engineer's PM will communicate directly with Abby Mazza, AIS Project Manager, (312) 744-3161 in the case of emergency.

The remediation contractor and individual subcontractors are required to cooperate with the SSC, within the parameters of their scopes of work.

Engineer personnel and their subcontractors are required to report all injuries, illnesses, spills, fires, and property damage to the SSC. The SSC must be notified of any on-site emergencies, and is responsible for ensuring that the appropriate emergency procedures described in this section are followed. As a courtesy, the local fire or emergency response department can be supplied with a copy of the HASP/RPP before site work begins.

11.3 EMERGENCY RECOGNITION AND PREVENTION

Table 4-2 lists potential on-site radiological hazards. On-site personnel will be made familiar with this information and with techniques of hazard recognition through pre-work training and site-specific briefings.

11.4 EVACUATION ROUTES AND PROCEDURES

In the event of an emergency that necessitates evacuation of a work task area or the site, the Engineer's SSC will contact all nearby personnel using the on-site communications discussed in Section 9.1 to advise the personnel of the emergency. The personnel will proceed along site roads to a safe distance upwind from the hazard source. The personnel will remain in that area until the SSC or an authorized individual provides further instructions.

11.5 EMERGENCY CONTACTS AND NOTIFICATIONS

The emergency information before the introduction of this HASP/RPP includes names and telephone numbers of emergency contact personnel. ***THIS PAGE MUST BE POSTED ON SITE OR MUST BE READILY AVAILABLE AT ALL TIMES IN THE SUPPORT ZONE.*** In the event of a medical emergency, personnel will notify the appropriate emergency organization and will take direction from the Engineer's SSC. In the event of a fire, explosion, or spill at the site, the SSC will notify the appropriate emergency contact, as well as follow the proper internal notification procedures

11.6 HOSPITAL ROUTE DIRECTIONS

Before any site activities begin, the Engineer and remediation contractor personnel will conduct a pre-emergency hospital run to familiarize themselves with the route to the local hospital. A map showing the hospital route is provided at the beginning of this HASP/RPP.

11.7 EMERGENCY MEDICAL TREATMENT PROCEDURES

A person who becomes ill or injured during work tasks may require decontamination. If the illness or injury is minor, any decontamination necessary will be completed and first aid should be administered before the patient is transported. If the patient's condition is serious, partial decontamination will be completed (such as complete disrobing of the person and redressing of the person in clean coveralls or wrapping in a blanket). First aid should be administered until an ambulance or paramedics arrive. All injuries and illnesses must be reported immediately to the Engineer's PM and HSR.

Any person transported to a clinic or hospital for radiological exposure treatment will be accompanied by information on the radiological hazard to which he or she has been exposed to at the site, if possible. Table 4-2 lists this information.

11.8 PROTECTIVE EQUIPMENT FAILURE

If any worker in the exclusion zone experiences a failure of protective equipment (either engineering controls or PPE) that affects his or her personal protection, the worker and all coworkers will immediately leave the exclusion zone. Re-entry to the site zone will not be permitted until (1) the protective equipment has been repaired or replaced, (2) the cause of the equipment failure has been determined, and (3) the equipment failure is no longer considered a threat.

11.9 FIRE OR EXPLOSION

In the event of a fire or explosion on site, the local fire department will be immediately summoned. The Engineer's SSC or a site representative will advise the fire department of the location and nature of any hazardous materials involved. Appropriate provisions of Section 11.0 will be implemented by site personnel.

11.10 INFECTIOUS DISEASE

Site work and site work procedures may be impacted by infectious disease or pandemics. General contingency procedures will be in place which could be implemented in the event remediation activities are on-going during a pandemic, such as social distancing, providing masks to personnel, providing additional hand sanitizer, providing additional hand washing stations, etc. Additional information on working while addressing and attempting to prevent the spread of infectious disease is presented in the applicable SWP.

11.11 WEATHER-RELATED EMERGENCIES

Site work will not be conducted during severe weather conditions, including high-speed winds or lightning. In the event of severe weather, field personnel will stop work, secure and lower all equipment (for example, drill rig), and seek shelter.

Thermal stress caused by excessive heat or cold may occur as a result of extreme temperatures, workload, or the PPE used. Heat and cold stress treatment will be administered as described in relevant safe work practices.

11.12 SPILLS OR LEAKS

In the event of a severe spill or a leak, site personnel will conduct the following procedures:

- Evacuate the affected area and relocate personnel to an upwind location.
- Inform the Engineer's SSC or Field Team Leader.
- Locate the source of the spill or leak, and stop the flow if safe to do so.
- Begin containment and recovery of spilled or leaked materials.
- Notify appropriate local, state, and federal agencies.

Additional information on spill and leak control is presented in the applicable SWP.

11.13 EMERGENCY EQUIPMENT AND FACILITIES

The following emergency equipment will be available on site:

- First aid kit (located in support zone)
- Eye wash (portable) (located in support zone)
- Mobile telephone
- Sorbent material
- Drums
- Monitoring stations.

11.14 REPORTING

All emergency situations require follow-up and reporting. An employee involved in an incident will immediately report the incident to the local Engineer Office HSR, Regional Safety Officer, or Engineer's

HSR via phone. The Engineer's Incident Report (Form IR) must be completed by the Engineer's PM and submitted to the Engineer's HSR within 24 hours of an emergency. The report must include proposed actions to prevent similar incidents from occurring. The HSR must be fully informed of the corrective action process so that he may implement applicable elements of the process at other sites.

12.0 EMERGENCY RESPONSE AND CONTINGENCIES INVOLVING RADIOLOGICAL CONTAMINATION

The following sections address provisions for a contaminated worker, life-threatening emergencies, minor first aid cases, and first aid and CPR.

12.1 PROVISIONS FOR A CONTAMINATED WORKER

If a worker does not have an emergency-related accident or illness, he or she will be checked for contamination and decontaminated if necessary before leaving the site. If the worker does have need for emergency care, he or she will proceed directly through the CRZ to the proper facilities. The hospital route and emergency phone numbers are provided on page viii.

12.2 LIFE-THREATENING EMERGENCIES

In the case of a life-threatening emergency, implement first aid procedures and immediately dial (911) for emergency medical assistance. Take measures to prevent any further damage or injury. Notify appropriate individuals as soon as possible. Procedures to follow during medical emergencies are in Section 11.7.

12.3 MINOR FIRST AID CASES

All Engineer personnel are expected to be responsible for reporting ANY unsafe conditions, behaviors or incidents -- including injuries, illnesses, fires, spills/releases, property damages and near-misses -- they face or encounter while performing their work. According to the Engineer's reporting procedures, for non-emergency incidents the Engineer's personnel should:

- Notify Incident Intervention
- Notify your Office, Project or Safety Manager via phone immediately.
- Complete an "Engineer Incident Report" (Form IR) within 24 hours and send it to your Safety Manager. If an injury or illness has occurred, the Form IR-A must also be completed.
- Additional reports may be necessary.

Minor first aid cases may be treated on site by personnel trained in first aid using approved first aid kits. After treatment from on-site personnel, the treated person will report to his/her immediate supervisor or the RSO.

12.4 FIRST AID AND CARDIOPULMONARY RESUSCITATION

The Engineer will supply a minimum of one employee trained and certified in first aid and CPR on site at any time that work occurs.

13.0 DISPOSAL OF INVESTIGATION-DERIVED WASTE

Investigation-derived waste (IDW) is waste generated during remediation activities or during previous investigation activities at the site that is suspected or known to be radiologically-contaminated. IDW may include sample media and wastewater generated during decontamination procedures. Wastewater or sample media generated during decontamination may be containerized in U.S. Department of Transportation (DOT)-approved 55-gallon drums staged within a secured area of the site pending transport to an approved off-site facility for disposal waste. Wastewater alternatively could be managed with on-site groundwater from the excavation area to be processed through AIS's remediation contractor's on-site water treatment system.

IDW will also include disposable PPE and disposable supplies such as sample tubing. The Engineer and Engineer's RSO will assume spent PPE and disposable supplies used in the exclusion zone exceeds the surface contamination release criteria in 32 IAC 340 Appendix A. This assumption is out of an abundance of caution and in an effort to save time surveying and characterizing all PPE used within the exclusion zone. This waste will be containerized and staged on the site to await off-site transportation or shipped with radiologically-contaminated soil for disposal as radiological waste.

General refuse is only waste material generated on the site that has not come into contact with contaminated environmental media. General refuse will primarily be from the support zone and may include cardboard, plastic, paper, ice bags, plastic bottles, and other uncontaminated refuse. Some general refuse may be collected in the CRZ such as plastic packaging from disposable boot covers for site visitors, cardboard, ice bags, plastic bottles, and other uncontaminated refuse. General refuse generated during removal activities will be disposed of in an on-site or an off-site dumpster or other trash receptacle.

ATSDR TOXFAQS

- Arsenic Toxicological Fact Sheet
 - Lead Toxicological Fact Sheet
 - Mercury Toxicological Fact Sheet
 - Naphthalene Toxicological Fact Sheet
 - PAH Toxicological Fact Sheet
 - Radium Toxicological Fact Sheet
 - Thorium Toxicological Fact Sheet
 - Uranium Toxicological Fact Sheet
-

This fact sheet answers the most frequently asked health questions (FAQs) about arsenic. For more information, call the CDC Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to higher than average levels of arsenic occur mostly in the workplace, near hazardous waste sites, or in areas with high natural levels. At high levels, inorganic arsenic can cause death. Exposure to lower levels for a long time can cause a discoloration of the skin and the appearance of small corns or warts. Arsenic has been found in at least 1,149 of the 1,684 National Priority List (NPL) sites identified by the Environmental Protection Agency (EPA).

What is arsenic?

Arsenic is a naturally occurring element widely distributed in the earth's crust. In the environment, arsenic is combined with oxygen, chlorine, and sulfur to form inorganic arsenic compounds. Arsenic in animals and plants combines with carbon and hydrogen to form organic arsenic compounds.

Inorganic arsenic compounds are mainly used to preserve wood. Copper chromated arsenate (CCA) is used to make "pressure-treated" lumber. CCA is no longer used in the U.S. for residential uses; it is still used in industrial applications. Organic arsenic compounds are used as pesticides, primarily on cotton fields and orchards.

What happens to arsenic when it enters the environment?

- Arsenic occurs naturally in soil and minerals and may enter the air, water, and land from wind-blown dust and may get into water from runoff and leaching.
- Arsenic cannot be destroyed in the environment. It can only change its form.
- Rain and snow remove arsenic dust particles from the air.
- Many common arsenic compounds can dissolve in water. Most of the arsenic in water will ultimately end up in soil or sediment.
- Fish and shellfish can accumulate arsenic; most of this arsenic is in an organic form called arsenobetaine that is much less harmful.

How might I be exposed to arsenic?

- Ingesting small amounts present in your food and water or breathing air containing arsenic.
- Breathing sawdust or burning smoke from wood treated with arsenic.
- Living in areas with unusually high natural levels of arsenic in rock.
- Working in a job that involves arsenic production or use, such as copper or lead smelting, wood treating, or pesticide application.

How can arsenic affect my health?

Breathing high levels of inorganic arsenic can give you a sore throat or irritated lungs.

Ingesting very high levels of arsenic can result in death. Exposure to lower levels can cause nausea and vomiting, decreased production of red and white blood cells, abnormal heart rhythm, damage to blood vessels, and a sensation of "pins and needles" in hands and feet.

Ingesting or breathing low levels of inorganic arsenic for a long time can cause a darkening of the skin and the appearance of small "corns" or "warts" on the palms, soles, and torso.

Skin contact with inorganic arsenic may cause redness and swelling.

Almost nothing is known regarding health effects of organic arsenic compounds in humans. Studies in animals show that some simple organic arsenic

Arsenic

CAS # 7440-38-2

compounds are less toxic than inorganic forms. Ingestion of methyl and dimethyl compounds can cause diarrhea and damage to the kidneys.

How likely is arsenic to cause cancer?

Several studies have shown that ingestion of inorganic arsenic can increase the risk of skin cancer and cancer in the liver, bladder, and lungs. Inhalation of inorganic arsenic can cause increased risk of lung cancer. The Department of Health and Human Services (DHHS) and the EPA have determined that inorganic arsenic is a known human carcinogen. The International Agency for Research on Cancer (IARC) has determined that inorganic arsenic is carcinogenic to humans.

How can arsenic affect children?

There is some evidence that long-term exposure to arsenic in children may result in lower IQ scores. There is also some evidence that exposure to arsenic in the womb and early childhood may increase mortality in young adults.

There is some evidence that inhaled or ingested arsenic can injure pregnant women or their unborn babies, although the studies are not definitive. Studies in animals show that large doses of arsenic that cause illness in pregnant females, can also cause low birth weight, fetal malformations, and even fetal death. Arsenic can cross the placenta and has been found in fetal tissues. Arsenic is found at low levels in breast milk.

How can families reduce the risks of exposure to arsenic?

- If you use arsenic-treated wood in home projects, you should wear dust masks, gloves, and protective clothing to decrease exposure to sawdust.
- If you live in an area with high levels of arsenic in water or soil, you should use cleaner sources of water and limit contact with soil.

- If you work in a job that may expose you to arsenic, be aware that you may carry arsenic home on your clothing, skin, hair, or tools. Be sure to shower and change clothes before going home.

Is there a medical test to determine whether I've been exposed to arsenic?

There are tests available to measure arsenic in your blood, urine, hair, and fingernails. The urine test is the most reliable test for arsenic exposure within the last few days. Tests on hair and fingernails can measure exposure to high levels of arsenic over the past 6-12 months. These tests can determine if you have been exposed to above-average levels of arsenic. They cannot predict whether the arsenic levels in your body will affect your health.

Has the federal government made recommendations to protect human health?

The EPA has set limits on the amount of arsenic that industrial sources can release to the environment and has restricted or cancelled many of the uses of arsenic in pesticides. EPA has set a limit of 0.01 parts per million (ppm) for arsenic in drinking water.

The Occupational Safety and Health Administration (OSHA) has set a permissible exposure limit (PEL) of 10 micrograms of arsenic per cubic meter of workplace air (10 µg/m³) for 8 hour shifts and 40 hour work weeks.

ToxFAQs™ Internet address via WWW is <http://www.atsdr.cdc.gov/toxfaqs/index.asp>.

ATSDR can tell you where to find occupational and environmental health clinics. Their specialists can recognize, evaluate, and treat illnesses resulting from exposure to hazardous substances. You can also contact your community or state health or environmental quality department if you have any more questions or concerns.

This fact sheet answers the most frequently asked health questions (FAQs) about lead. For more information, call the CDC Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to lead can happen from breathing workplace air or dust, eating contaminated foods, or drinking contaminated water. Children can be exposed from eating lead-based paint chips or playing in contaminated soil. Lead can damage the nervous system, kidneys, and reproductive system. Lead has been found in at least 1,272 of the 1,684 National Priority List (NPL) sites identified by the Environmental Protection Agency (EPA).

What is lead?

Lead is a naturally occurring bluish-gray metal found in small amounts in the earth's crust. Lead can be found in all parts of our environment. Much of it comes from human activities including burning fossil fuels, mining, and manufacturing.

Lead has many different uses. It is used in the production of batteries, ammunition, metal products (solder and pipes), and devices to shield X-rays. Because of health concerns, lead from paints and ceramic products, caulking, and pipe solder has been dramatically reduced in recent years. The use of lead as an additive to gasoline was banned in 1996 in the United States.

What happens to lead when it enters the environment?

- Lead itself does not break down, but lead compounds are changed by sunlight, air, and water.
- When lead is released to the air, it may travel long distances before settling to the ground.
- Once lead falls onto soil, it usually sticks to soil particles.
- Movement of lead from soil into groundwater will depend on the type of lead compound and the characteristics of the soil.

How might I be exposed to lead?

- Eating food or drinking water that contains lead. Water pipes in some older homes may contain lead solder. Lead can leach out into the water.
- Spending time in areas where lead-based paints have been used and are deteriorating. Deteriorating lead paint can contribute to lead dust.
- Working in a job where lead is used or engaging in certain hobbies in which lead is used, such as making stained glass.

- Using health-care products or folk remedies that contain lead.

How can lead affect my health?

The effects of lead are the same whether it enters the body through breathing or swallowing. Lead can affect almost every organ and system in your body. The main target for lead toxicity is the nervous system, both in adults and children. Long-term exposure of adults can result in decreased performance in some tests that measure functions of the nervous system. It may also cause weakness in fingers, wrists, or ankles. Lead exposure also causes small increases in blood pressure, particularly in middle-aged and older people and can cause anemia. Exposure to high lead levels can severely damage the brain and kidneys in adults or children and ultimately cause death. In pregnant women, high-levels of exposure to lead may cause miscarriage. High-level exposure in men can damage the organs responsible for sperm production.

How likely is lead to cause cancer?

We have no conclusive proof that lead causes cancer in humans. Kidney tumors have developed in rats and mice that had been given large doses of some kind of lead compounds. The Department of Health and Human Services (DHHS) has determined that lead and lead compounds are reasonably anticipated to be human carcinogens and the EPA has determined that lead is a probable human carcinogen. The International Agency for Research on Cancer (IARC) has determined that inorganic lead is probably carcinogenic to humans and that there is insufficient information to determine whether organic lead compounds will cause cancer in humans.

Lead

CAS # 7439-92-1

How can lead affect children?

Small children can be exposed by eating lead-based paint chips, chewing on objects painted with lead-based paint, or swallowing house dust or soil that contains lead.

Children are more vulnerable to lead poisoning than adults. A child who swallows large amounts of lead may develop blood anemia, severe stomachache, muscle weakness, and brain damage. If a child swallows smaller amounts of lead, much less severe effects on blood and brain function may occur. Even at much lower levels of exposure, lead can affect a child's mental and physical growth.

Exposure to lead is more dangerous for young and unborn children. Unborn children can be exposed to lead through their mothers. Harmful effects include premature births, smaller babies, decreased mental ability in the infant, learning difficulties, and reduced growth in young children. These effects are more common if the mother or baby was exposed to high levels of lead. Some of these effects may persist beyond childhood.

How can families reduce the risks of exposure to lead?

- Avoid exposure to sources of lead.
- Do not allow children to chew or mouth surfaces that may have been painted with lead-based paint.
- If you have a water lead problem, run or flush water that has been standing overnight before drinking or cooking with it.
- Some types of paints and pigments that are used as make-up or hair coloring contain lead. Keep these kinds of products away from children.
- If your home contains lead-based paint or you live in an area contaminated with lead, wash children's hands and faces often to remove lead dusts and soil, and regularly clean the house of dust and tracked in soil.

Is there a medical test to determine whether I've been exposed to lead?

A blood test is available to measure the amount of lead in your blood and to estimate the amount of your recent exposure

to lead. Blood tests are commonly used to screen children for lead poisoning. Lead in teeth or bones can be measured by X-ray techniques, but these methods are not widely available. Exposure to lead also can be evaluated by measuring erythrocyte protoporphyrin (EP) in blood samples. EP is a part of red blood cells known to increase when the amount of lead in the blood is high. However, the EP level is not sensitive enough to identify children with elevated blood lead levels below about 25 micrograms per deciliter ($\mu\text{g}/\text{dL}$). These tests usually require special analytical equipment that is not available in a doctor's office. However, your doctor can draw blood samples and send them to appropriate laboratories for analysis.

Has the federal government made recommendations to protect human health?

The Centers for Disease Control and Prevention (CDC) recommends that states test children at ages 1 and 2 years. Children should be tested at ages 3–6 years if they have never been tested for lead, if they receive services from public assistance programs for the poor such as Medicaid or the Supplemental Food Program for Women, Infants, and Children, if they live in a building or frequently visit a house built before 1950; if they visit a home (house or apartment) built before 1978 that has been recently remodeled; and/or if they have a brother, sister, or playmate who has had lead poisoning. CDC has updated its recommendations on children's blood lead levels. Experts now use an upper reference level value of 97.5% of the population distribution for children's blood lead. In 2012-2015, the value to identify children with blood lead levels that are much higher than most children have, is 5 micrograms per deciliter ($\mu\text{g}/\text{dL}$). EPA limits lead in drinking water to 15 μg per liter.

ToxFAQs™ Internet address via WWW is <http://www.atsdr.cdc.gov/toxfaqs/index.asp>.

ATSDR can tell you where to find occupational and environmental health clinics. Their specialists can recognize, evaluate, and treat illnesses resulting from exposure to hazardous substances. You can also contact your community or state health or environmental quality department if you have any more questions or concerns.

This fact sheet answers the most frequently asked health questions (FAQs) about mercury. For more information, call the CDC Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to mercury occurs from breathing contaminated air, ingesting contaminated water and food, and having dental and medical treatments. Mercury, at high levels, may damage the brain, kidneys, and developing fetus. This chemical has been found in at least 714 of 1,467 National Priorities List (NPL) sites identified by the Environmental Protection Agency (EPA).

What is mercury?

Mercury is a naturally occurring metal which has several forms. The metallic mercury is a shiny, silver-white, odorless liquid. If heated, it is a colorless, odorless gas.

Mercury combines with other elements, such as chlorine, sulfur, or oxygen, to form inorganic mercury compounds or "salts," which are usually white powders or crystals. Mercury also combines with carbon to make organic mercury compounds. The most common one, methylmercury, is produced mainly by microscopic organisms in the water and soil. More mercury in the environment can increase the amounts of methylmercury that these small organisms make.

Metallic mercury is used to produce chlorine gas and caustic soda, and is also used in thermometers, some dental fillings, and batteries. Mercury salts are sometimes used in skin lightening creams and as antiseptic creams and ointments.

What happens to mercury when it enters the environment?

- Inorganic mercury (metallic mercury and inorganic mercury compounds) enters the air from mining ore deposits, burning coal and waste, and from manufacturing plants.
- It enters the water or soil from natural deposits, disposal of wastes, and volcanic activity.
- Methylmercury may be formed in water and soil by small organisms called bacteria.

- Methylmercury builds up in the tissues of fish. Larger and older fish tend to have the highest levels of mercury.

How might I be exposed to mercury?

- Eating fish or shellfish contaminated with methylmercury.
- Breathing vapors in air from spills, incinerators, and industries that burn mercury-containing fossil fuels.
- Release of mercury from dental work and medical treatments.
- Breathing contaminated workplace air or skin contact during use in the workplace.
- Practicing rituals that include mercury.

How can mercury affect my health?

The nervous system is very sensitive to all forms of mercury. Methylmercury and metallic mercury vapors are more harmful than other forms, because more mercury in these forms reaches the brain. Exposure to high levels of metallic, inorganic, or organic mercury can permanently damage the brain, kidneys, and developing fetus. Effects on brain functioning may result in irritability, shyness, tremors, changes in vision or hearing, and memory problems.

Short-term exposure to high levels of metallic mercury vapors may cause effects including lung damage, nausea, vomiting, diarrhea, increases in blood pressure or heart rate, skin rashes, and eye irritation.

Mercury

CAS # 7439-97-6

How likely is mercury to cause cancer?

There are inadequate human cancer data available for all forms of mercury. Mercuric chloride has caused increases in several types of tumors in rats and mice, and methylmercury has caused kidney tumors in male mice. The EPA has determined that mercuric chloride and methylmercury are possible human carcinogens.

How can mercury affect children?

Very young children are more sensitive to mercury than adults. Mercury in the mother's body passes to the fetus and may accumulate there, possibly causing damage to the developing nervous system. It can also pass to a nursing infant through breast milk. However, the benefits of breast feeding may be greater than the possible adverse effects of mercury in breast milk.

Mercury's harmful effects that may affect the fetus include brain damage, mental retardation, incoordination, blindness, seizures, and inability to speak. Children poisoned by mercury may develop problems of their nervous and digestive systems, and kidney damage.

How can families reduce the risk of exposure to mercury?

Carefully handle and dispose of products that contain mercury, such as thermometers or fluorescent light bulbs. Do not vacuum up spilled mercury, because it will vaporize and increase exposure. If a large amount of mercury has been spilled, contact your health department. Teach children not to play with shiny, silver liquids.

Properly dispose of older medicines that contain mercury. Keep all mercury-containing medicines away from children.

Pregnant women and children should keep away from rooms where liquid mercury has been used.

Learn about wildlife and fish advisories in your area from your public health or natural resources department.

Is there a medical test to determine whether I've been exposed to mercury?

Tests are available to measure mercury levels in the body. Blood or urine samples are used to test for exposure to metallic mercury and to inorganic forms of mercury. Mercury in whole blood or in scalp hair is measured to determine exposure to methylmercury. Your doctor can take samples and send them to a testing laboratory.

Has the federal government made recommendations to protect human health?

The EPA has set a limit of 2 parts of mercury per billion parts of drinking water (2 ppb).

The Food and Drug Administration (FDA) has set a maximum permissible level of 1 part of methylmercury in a million parts of seafood (1 ppm).

The Occupational Safety and Health Administration (OSHA) has set limits of 0.1 milligram of organic mercury per cubic meter of workplace air (0.1 mg/m^3) and 0.05 mg/m^3 of metallic mercury vapor for 8-hour shifts and 40-hour work weeks.

For more information, contact the Agency for Toxic Substances and Disease Registry, Division of Toxicology and Human Health Sciences, 1600 Clifton Road NE, Mailstop F-57, Atlanta, GA 30333.

Phone: 1-800-232-4636.

ToxFAQs™ Internet address via WWW is <http://www.atsdr.cdc.gov/toxfaqs/index.asp>.

ATSDR can tell you where to find occupational and environmental health clinics. Their specialists can recognize, evaluate, and treat illnesses resulting from exposure to hazardous substances. You can also contact your community or state health or environmental quality department if you have any more questions or concerns.

This fact sheet answers the most frequently asked health questions (FAQs) about naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because these substances may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to naphthalene, 1-methylnaphthalene, or 2-methylnaphthalene happens mostly from breathing air contaminated from the burning of wood, tobacco, or fossil fuels, industrial discharges, or moth repellents. Exposure to large amounts of naphthalene may damage or destroy some of your red blood cells. Naphthalene has caused cancer in animals. Naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene have been found in at least 687, 36, and 412, respectively, of the 1,662 National Priority List sites identified by the Environmental Protection Agency (EPA).

What are naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene?

Naphthalene is a white solid that evaporates easily. Fuels such as petroleum and coal contain naphthalene. It is also called white tar, and tar camphor, and has been used in mothballs and moth flakes. Burning tobacco or wood produces naphthalene. It has a strong, but not unpleasant smell. The major commercial use of naphthalene is in the manufacture of polyvinyl chloride (PVC) plastics. Its major consumer use is in moth repellents and toilet deodorant blocks.

1-Methylnaphthalene and 2-methylnaphthalene are naphthalene-related compounds. 1-Methylnaphthalene is a clear liquid and 2-methylnaphthalene is a solid; both can be smelled in air and in water at very low concentrations.

1-Methylnaphthalene and 2-methylnaphthalene are used to make other chemicals such as dyes and resins. 2-Methylnaphthalene is also used to make vitamin K.

What happens to naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene when they enter the environment?

- ☐ Naphthalene enters the environment from industrial and domestic sources, and from accidental spills.
- ☐ Naphthalene can dissolve in water to a limited degree and may be present in drinking water from wells close to hazardous waste sites and landfills.
- ☐ Naphthalene can become weakly attached to soil or pass through soil into underground water.
- ☐ In air, moisture and sunlight break it down within 1 day. In water, bacteria break it down or it evaporates into the air.
- ☐ Naphthalene does not accumulate in the flesh of animals or fish that you might eat.

- ☐ 1-Methylnaphthalene and 2-methylnaphthalene are expected to act like naphthalene in air, water, or soil because they have similar chemical and physical properties.

How might I be exposed to naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene?

- ☐ Breathing low levels in outdoor air.
- ☐ Breathing air contaminated from industrial discharges or smoke from burning wood, tobacco, or fossil fuels.
- ☐ Using or making moth repellents, coal tar products, dyes or inks could expose you to these chemicals in the air.
- ☐ Drinking water from contaminated wells.
- ☐ Touching fabrics that are treated with moth repellents containing naphthalene.
- ☐ Exposure to naphthalene, 1-methylnaphthalene and 2-methylnaphthalene from eating foods or drinking beverages is unlikely.

How can naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene affect my health?

Exposure to large amounts of naphthalene may damage or destroy some of your red blood cells. This could cause you to have too few red blood cells until your body replaces the destroyed cells. This condition is called hemolytic anemia. Some symptoms of hemolytic anemia are fatigue, lack of appetite, restlessness, and pale skin. Exposure to large amounts of naphthalene may also cause nausea, vomiting, diarrhea, blood in the urine, and a yellow color to the skin. Animals sometimes develop cloudiness in their eyes after swallowing high amounts of naphthalene. It is not clear whether this also develops in people. Rats and mice that breathed naphthalene vapors daily for a lifetime developed irritation and inflammation of their nose and lungs. It is unclear if naphthalene

ToxFAQs™ Internet address is <http://www.atsdr.cdc.gov/toxfaq.html>

causes reproductive effects in animals; most evidence says it does not.

There are no studies of humans exposed to 1-methylnaphthalene or 2-methylnaphthalene.

Mice fed food containing 1-methylnaphthalene and 2-methylnaphthalene for most of their lives had part of their lungs filled with an abnormal material.

How likely are naphthalene, 1-methylnaphthalene, or 2-methylnaphthalene to cause cancer?

There is no direct evidence in humans that naphthalene, 1-methylnaphthalene, or 2-methylnaphthalene cause cancer. However, cancer from naphthalene exposure has been seen in animal studies. Some female mice that breathed naphthalene vapors daily for a lifetime developed lung tumors. Some male and female rats exposed to naphthalene in a similar manner also developed nose tumors.

Based on the results from animal studies, the Department of Health and Human Services (DHHS) concluded that naphthalene is reasonably anticipated to be a human carcinogen. The International Agency for Research on Cancer (IARC) concluded that naphthalene is possibly carcinogenic to humans. The EPA determined that naphthalene is a possible human carcinogen (Group C) and that the data are inadequate to assess the human carcinogenic potential of 2-methylnaphthalene.

How can naphthalene, 1-methylnaphthalene, or 2-methylnaphthalene affect children?

Hospitals have reported many cases of hemolytic anemia in children, including newborns and infants, who either ate naphthalene mothballs or deodorants cakes or who were in close contact with clothing or blankets stored in naphthalene mothballs. Naphthalene can move from a pregnant woman's blood to the unborn baby's blood. Naphthalene has been detected in some samples of breast milk from the general U.S. population, but not at levels that are expected to be of concern.

There is no information on whether naphthalene has affected development in humans. No developmental abnormalities were observed in the offspring from rats, mice, and rabbits fed naphthalene during pregnancy.

We do not have any information on possible health effects of 1-methylnaphthalene or 2-methylnaphthalene on children.

How can families reduce the risks of exposure to naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene?

❑ Families can reduce the risks of exposure to naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene by avoiding smoking tobacco, generating smoke during cooking, or using

fireplaces or heating appliances in their homes.

❑ If families use naphthalene-containing moth repellents, the material should be enclosed in containers that prevent vapors from escaping, and kept out of the reach from children.

❑ Blankets and clothing stored with naphthalene moth repellents should be aired outdoors to remove naphthalene odors and washed before they are used.

❑ Families should inform themselves of the contents of air deodorizers that are used in their homes and refrain from using deodorizers with naphthalene.

Is there a medical test to determine whether I've been exposed to naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene?

Tests are available that measure levels of these chemicals and their breakdown products in samples of urine, feces, blood, maternal milk, or body fat. These tests are not routinely available in a doctor's office because they require special equipment, but samples can be sent to special testing laboratories. These tests cannot determine exactly how much naphthalene, 1-methylnaphthalene, or 2-methylnaphthalene you were exposed to or predict whether harmful effects will occur. If the samples are collected within a day or two of exposure, then the tests can show if you were exposed to a large or small amount of naphthalene, 1-methylnaphthalene, or 2-methylnaphthalene.

Has the federal government made recommendations to protect human health?

The EPA recommends that children not drink water with over 0.5 parts per million (0.5 ppm) naphthalene for more than 10 days or over 0.4 ppm for any longer than 7 years. Adults should not drink water with more than 1 ppm for more than 7 years. For water consumed over a lifetime (70 years), the EPA suggests that it contain no more than 0.1 ppm naphthalene.

The Occupational Safety and Health Administration (OSHA) set a limit of 10 ppm for the level of naphthalene in workplace air during an 8-hour workday, 40-hour workweek. The National Institute for Occupational Safety and Health (NIOSH) considers more than 500 ppm of naphthalene in air to be immediately dangerous to life or health. This is the exposure level of a chemical that is likely to impair a worker's ability to leave a contaminate area and therefore, results in permanent health problems or death.

Polycyclic Aromatic Hydrocarbons (PAHs) - ToxFAQs™

This fact sheet answers the most frequently asked health questions (FAQs) about polycyclic aromatic hydrocarbons (PAHs). For more information, call the CDC Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. This information is important because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

SUMMARY: Exposure to polycyclic aromatic hydrocarbons usually occurs by breathing air contaminated by wild fires or coal tar, or by eating foods that have been grilled. PAHs have been found in at least 600 of the 1,430 National Priorities List (NPL) sites identified by the Environmental Protection Agency (EPA).

What are polycyclic aromatic hydrocarbons?

(Pronounced pŏl'i-sī'klīk ār'ə-măt'īk hī'drə-kar'bənz)

Polycyclic aromatic hydrocarbons (PAHs) are a group of over 100 different chemicals that are formed during the incomplete burning of coal, oil and gas, garbage, or other organic substances like tobacco or charbroiled meat. PAHs are usually found as a mixture containing two or more of these compounds, such as soot.

Some PAHs are manufactured. These pure PAHs usually exist as colorless, white, or pale yellow-green solids. PAHs are found in coal tar, crude oil, creosote, and roofing tar, but a few are used in medicines or to make dyes, plastics, and pesticides.

What happens to PAHs when they enter the environment?

- PAHs enter the air mostly as releases from volcanoes, forest fires, burning coal, and automobile exhaust.
- PAHs can occur in air attached to dust particles.
- Some PAH particles can readily evaporate into the air from soil or surface waters.
- PAHs can break down by reacting with sunlight and other chemicals in the air, over a period of days to weeks.
- PAHs enter water through discharges from industrial and wastewater treatment plants.

- Most PAHs do not dissolve easily in water. They stick to solid particles and settle to the bottoms of lakes or rivers.
- Microorganisms can break down PAHs in soil or water after a period of weeks to months.
- In soils, PAHs are most likely to stick tightly to particles; certain PAHs move through soil to contaminate underground water.
- PAH contents of plants and animals may be much higher than PAH contents of soil or water in which they live.

How might I be exposed to PAHs?

- Breathing air containing PAHs in the workplace of coking, coal-tar, and asphalt production plants; smokehouses; and municipal trash incineration facilities.
- Breathing air containing PAHs from cigarette smoke, wood smoke, vehicle exhausts, asphalt roads, or agricultural burn smoke.
- Coming in contact with air, water, or soil near hazardous waste sites.
- Eating grilled or charred meats; contaminated cereals, flour, bread, vegetables, fruits, meats; and processed or pickled foods.
- Drinking contaminated water or cow's milk.
- Nursing infants of mothers living near hazardous waste sites may be exposed to PAHs through their mother's milk.

Polycyclic Aromatic Hydrocarbons

How can PAHs affect my health?

Mice that were fed high levels of one PAH during pregnancy had difficulty reproducing and so did their offspring. These offspring also had higher rates of birth defects and lower body weights. It is not known whether these effects occur in people.

Animal studies have also shown that PAHs can cause harmful effects on the skin, body fluids, and ability to fight disease after both short- and long-term exposure. But these effects have not been seen in people.

How likely are PAHs to cause cancer?

The Department of Health and Human Services (DHHS) has determined that some PAHs may reasonably be expected to be carcinogens.

Some people who have breathed or touched mixtures of PAHs and other chemicals for long periods of time have developed cancer. Some PAHs have caused cancer in laboratory animals when they breathed air containing them (lung cancer), ingested them in food (stomach cancer), or had them applied to their skin (skin cancer).

Is there a medical test to show whether I've been exposed to PAHs?

In the body, PAHs are changed into chemicals that can attach to substances within the body. There are special tests that can detect PAHs attached to these substances in body tissues or blood. However, these tests cannot tell whether any health effects will occur or find out the extent or source of your exposure to the PAHs. The tests aren't usually available in your doctor's office because special equipment is needed to conduct them.

Has the federal government made recommendations to protect human health?

The Occupational Safety and Health Administration (OSHA) has set a limit of 0.2 milligrams of PAHs per cubic meter of air (0.2 mg/m^3). The OSHA Permissible Exposure Limit (PEL) for mineral oil mist that contains PAHs is 5 mg/m^3 averaged over an 8-hour exposure period.

The National Institute for Occupational Safety and Health (NIOSH) recommends that the average workplace air levels for coal tar products not exceed 0.1 mg/m^3 for a 10-hour workday, within a 40-hour workweek. There are other limits for workplace exposure for things that contain PAHs, such as coal, coal tar, and mineral oil.

Glossary

Carcinogen: A substance that can cause cancer.

Ingest: Take food or drink into your body.

Agency for Toxic Substances and Disease Registry (ATSDR). 1995. Toxicological profile for polycyclic aromatic hydrocarbons. Atlanta, GA: U.S. Department of Health and Human Services, Public Health Service.

Where can I get more information?

For more information, contact the Agency for Toxic Substances and Disease Registry, Division of Toxicology and Human Health Sciences, 1600 Clifton Road NE, Mailstop F-57, Atlanta, GA 30333.

Phone: 1-800-232-4636.

ToxFAQs™ Internet address via WWW is <http://www.atsdr.cdc.gov/toxfaqs/index.asp>.

ATSDR can tell you where to find occupational and environmental health clinics. Their specialists can recognize, evaluate, and treat illnesses resulting from exposure to hazardous substances. You can also contact your community or state health or environmental quality department if you have any more questions or concerns.

This fact sheet answers the most frequently asked health questions (FAQs) about radium. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Radium is a radioactive substance formed from the breakdown of uranium and thorium. Exposure to high levels results in an increased risk of bone, liver, and breast cancer. This chemical has been found in at least 18 of the 1,177 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is radium?

(Pronounced rā'dē-əm)

Radium is a naturally occurring silvery-white radioactive metal that can exist in several forms called isotopes. Radium is formed when uranium and thorium break down in the environment. Uranium and thorium are found in small amounts in most rocks and soil. Two of the main radium isotopes found in the environment are radium-226 and radium-228.

Radium undergoes radioactive decay. It divides into two parts—one part is called radiation and the other part is called a daughter. The daughter, like radium, is not stable, and it also divides into radiation and another daughter. The dividing of daughters continues until a stable, nonradioactive daughter is formed. During the decay process, alpha, beta, and gamma radiation are released. Alpha particles can travel only a short distance and cannot travel through your skin. Beta particles can penetrate through your skin, but they cannot go all the way through your body. Gamma radiation can go all the way through your body.

Radium has been used as a radiation source for treating cancer, in radiography of metals, and combined with other

metals as a neutron source for research and radiation instrument calibration. Until the 1960s, radium was a component of the luminous paints used for watch and clock dials, instrument panels in airplanes, military instruments, and compasses.

What happens to radium when it enters the environment?

- ☐ Radium is constantly being produced by the radioactive decay of uranium and thorium.
- ☐ Radium is present at very low levels in rocks and soil and may strongly attach to those materials.
- ☐ Radium may also be found in air.
- ☐ High concentrations are found in water in some areas of the country.
- ☐ Uranium mining results in higher levels of radium in water near uranium mines.
- ☐ Radium in the soil may be absorbed by plants.
- ☐ It may concentrate in fish and other aquatic organisms.

How might I be exposed to radium?

- ☐ Everyone is exposed to low levels of radium in the air, water, and food.

ToxFAQs Internet address via WWW is <http://www.atsdr.cdc.gov/toxfaq.html>

- ☐ Higher levels may be found in the air near industries that burn coal or other fuels.
- ☐ It may be found at higher levels in drinking water from wells.
- ☐ Miners, particularly miners of uranium and hard rock, are exposed to higher levels of radium.
- ☐ It may also be found at radioactive waste disposal sites.

How can radium affect my health?

Radium has been shown to cause effects on the blood (anemia) and eyes (cataracts). It also has been shown to affect the teeth, causing an increase in broken teeth and cavities. Patients who were injected with radium in Germany, from 1946 to 1950, for the treatment of certain diseases including tuberculosis were significantly shorter as adults than people who were not treated.

How likely is radium to cause cancer?

Exposure to high levels of radium results in an increased incidence of bone, liver, and breast cancer. The EPA and the National Academy of Sciences, Committee on Biological Effects of Ionizing Radiation, has stated that radium is a known human carcinogen.

Is there a medical test to show whether I've been exposed to radium?

Urine tests can determine if you have been exposed to radium. Another test measures the amount of radon (a breakdown product of radium) in exhaled air. Both types of tests require special equipment and cannot be done in a doctor's office. These tests cannot tell how much radium you were exposed to, nor can they be used to predict whether you will develop harmful health effects.

Has the federal government made recommendations to protect human health?

The EPA has set a drinking water limit of 5 picocuries per liter (5 pCi/L) for radium-226 and radium-228 (combined).

The EPA has set a soil concentration limit for radium-226 in uranium and thorium mill tailings of 5 picocuries per gram (5 pCi/g) in the first 15 centimeters of soil and 15 pCi/g in deeper soil.

The federal recommendations have been updated as of July 1999.

Glossary

Anemia: A decreased ability of the blood to transport oxygen.

Carcinogen: A substance that can cause cancer.

CAS: Chemical Abstracts Service.

National Priorities List: A list of the nation's worst hazardous waste sites.

Picocurie (pCi): A unit used to measure the quantity of radioactive material.

rem: A unit used to measure radiation dose.

You can also contact your community or state health or environmental quality department if you have any more questions or concerns.

Thorium - ToxFAQs™

This fact sheet answers the most frequently asked health questions (FAQs) about thorium. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Thorium is a radioactive substance that occurs naturally in the environment. Thorium does not appear to cause cancer, except when intentionally injected intravenously. This chemical has been found in at least 16 of the 1,177 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What is thorium?

Pronounced (thô'-rē-m) Thorium is a naturally occurring, radioactive substance. In the environment, thorium exists in combination with other minerals, such as silica. Small amounts of thorium are present in all rocks, soil, water, plants, and animals. Soil contains an average of about 6 parts of thorium per million parts of soil (6 ppm). More than 99% of natural thorium exists in the form of thorium-232. It breaks down into two parts—a small part called “alpha” radiation and a large part called the decay product. The decay product is also not stable and continues to break down through a series of decay products until a stable product is formed. During these decay processes, radioactive substances are produced. These include radium and radon. These substances give off radiation, including alpha and beta particles, and gamma radiation. Some rocks in underground mines contain thorium in a more concentrated form. After these rocks are mined, thorium is usually concentrated and changed into thorium dioxide or other chemical forms. After most of the thorium is removed, the rocks are called “depleted” ore or tailings. Thorium is used to make ceramics, gas lantern mantles, and metals used in the aerospace industry and in nuclear reactions. Thorium can also be used as a fuel for generating nuclear energy. Thorium-227 (a form of thorium that comes from the decay of uranium) has been proposed to treat skeletal pain associated with cancers so as to improve the quality of life. Measuring the ratio of two radioactive forms of thorium have been used to determine if ivory from African elephant tusks was poached since 1976 when a European Union law went into effect.

What happens to thorium when it enters the environment?

- Thorium is a natural part of the environment.
- Thorium changes extremely slowly into other radioactive substances.
- It takes about 14 billion years for half of the thorium-232 to change into new forms.
- As rocks are broken up by wind and water, the thorium and all other components of the rocks become part of the soil.
- Thorium in soil can be washed into rivers and lakes.
- Windblown dust and volcanic eruptions are natural sources of thorium in the air.
- Burning coal may release small amounts of thorium into the air.
- Mining thorium or making products that contain it may also release thorium into the environment.

How might I be exposed to thorium?

- Just by being alive, everyone is exposed to small amounts of thorium in air, water, and food.
- by breathing air near facilities where uranium, phosphate, or tin ore is processed.
- by living in homes built on soil with high levels of thorium.
- by working in the uranium, thorium, tin, and phosphate mining, and gas mantle production industries.
- by living near radioactive waste disposal sites where thorium can enter the environment.

Thorium

How likely is thorium to affect my health?

Studies on thorium workers have shown that breathing dust containing thorium and other substances may damage the lung many years after being exposed. Sufficiently high exposure may also change the genetic material of those body cells where the thorium is deposited. However, thorium is not known to cause birth defects or to affect the ability to have children. One study showed that working in a thorium plant increased the chance of death in males but decreased the chance of death in females. Increasing the amount of thorium in your environment could increase your exposure to radium and radon. Health effects from those substances and other radioactive materials are the subjects of separate toxicological profiles prepared by ATSDR.

Thorium was once thought to cause cancer in mine and mill workers, but it was later concluded that thorium likely had no significant impact on their cancer risk. Cancers in those workers were likely due to their cigarette smoking and inhaling silica dust. Exposure to thorium has produced lung tumors in animals. Thorium is mildly radioactive (has a very long half-life) so health effects from exposure may be partly from the chemical itself and partly from the radiation it emits. The International Agency for Research on Cancer (IARC) has not found sufficient evidence to classify thorium in mines and mills as carcinogenic.

IARC and the National Toxicology Program (NTP) have determined that medical thorium (a colloid form used until 1955) did cause cancer. People who had large amounts of thorium injected into their blood for special medical x-ray tests had more than the usual number of cancers, particularly of the liver, gall bladder, and leukemia. Also, medical thorium has been found to cause liver cirrhosis and chromosome damage. When improperly injected, medical thorium caused cancer, fibrosis, nerve damage, pain, and blood vessel changes in those areas where thorium had leaked out of the blood vessel. NTP also considers that thorium dioxide can cause cancer if it is injected into the body, as in a medical procedure.

Is there a medical test to show whether I've been exposed to thorium?

Special tests that measure the level of radioactivity from thorium in your urine and feces, and radon gas in the air you exhale can determine if you have been exposed to high levels of thorium. These tests are only useful if done within several days to a week after exposure. The tests cannot tell you if your health will be affected by the exposure. They require special equipment and are probably not available at your local clinic or hospital.

Has the federal government made recommendations to protect human health?

The EPA has set a drinking water limit of 15 picocuries per liter of water (15 pCi/L) for gross alpha particle activity and 4 millirems per year for beta particles and photon activity (for example, gamma radiation and x-rays). These values apply to all radioactive materials and are not specific only to thorium.

Natural & Depleted Uranium - ToxFAQs™

CAS # 7440-61-1

This fact sheet answers the most frequently asked health questions (FAQs) about natural and depleted uranium. For more information, call the CDC Information Center at 1-800-232-4636. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It is important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Natural uranium is a naturally occurring chemical substance that is mildly radioactive. Depleted uranium is an adjusted mixture of natural uranium isotopes that is less radioactive. Everyone is exposed to low amounts of uranium through food, water, and air. Exposure to high levels of natural or depleted uranium can cause kidney disease. Uranium has been found in at least 67 of 1,699 National Priorities List (NPL) sites identified by the Environmental Protection Agency (EPA).

What is uranium?

Uranium is a naturally occurring radioactive element. It is naturally present in nearly all rocks, soils, and air; can be redistributed in the environment through wind and water erosion; and more can be released into the environment through volcanic eruptions. Natural uranium is a mixture of three isotopes: ^{234}U , ^{235}U , and ^{238}U . The most common isotope is ^{238}U ; it makes up over 99% of natural uranium. All three isotopes behave the same chemically, but they have different radioactive properties. The half-lives of uranium isotopes (the amount of time needed for half of the isotope to give off its radiation and change into a different element) is very long. The least radioactive isotope is ^{238}U with a half life of 4.5 billion years. Depleted uranium is a mixture of the same three uranium isotopes except that it has very little ^{234}U and ^{235}U . It is less radioactive than natural uranium. Enriched uranium is another mixture of isotopes that has more ^{234}U and ^{235}U than natural uranium. Enriched uranium is more radioactive than natural uranium.

Uranium is almost as hard as steel and much denser than lead. Natural uranium is used to make enriched uranium; depleted uranium is the leftover product. Enriched uranium is used to make fuel for nuclear power plants. Depleted uranium is used as a counterbalance on helicopters rotors and airplane control surfaces, as a shield to protect against ionizing radiation, as a component of munitions to help them penetrate enemy armored vehicles, and as armor in some parts of military vehicles.

What happens to uranium when it enters the environment?

- Natural and depleted uranium that exist in the dust in the air settle onto water, land, and plants. Uranium deposited on land can be reincorporated into soil, washed into surface water, or stick to plant roots. Uranium in air, surface water, or groundwater can be transported large distances.

How might I be exposed to uranium?

- Food and drinking water are the primary sources of intake for the general public. Very low levels of uranium are found in the air.
- Root crops such as potatoes, parsnips, turnips, and sweet potatoes contribute the highest amounts of uranium to the diet. Because uranium in soil can stick to these vegetables, the concentrations in these foods are directly related to the concentrations of uranium in the soil where the foods are grown.
- In most areas of the United States, low levels of uranium are found in the drinking water. Higher levels may be found in areas with elevated levels of naturally occurring uranium in rocks and soil.
- People may be exposed to higher levels of uranium if they live near uranium mining, processing, and manufacturing facilities. People may also be exposed if they live near areas where depleted uranium weapons are used.

How can uranium enter and leave my body?

Most of the uranium you breathe or ingest is not absorbed and leaves the body in the feces. Absorbed uranium is deposited throughout the body. The highest levels are found in the bones, liver, and kidneys; 66% of the uranium in the body is found in your bones. It can remain in the bones for a long time; the half-life of uranium in bones is 70–200 days. Most of the uranium that is not in bones leaves the body in the urine in 1–2 weeks.

How can uranium affect my health?

Natural uranium and depleted uranium have the identical chemical effect on your body. Kidney damage has been seen in humans and animals after inhaling or ingesting

Natural and Depleted Uranium

CAS # 7440-61-1

uranium compounds. However, kidney damage has not been consistently found in soldiers who have had uranium metal fragments in their bodies for several years. Ingesting water-soluble uranium compounds will result in kidney effects at lower doses than following exposure to insoluble uranium compounds.

Studies in animals have shown that inhalation exposure to insoluble uranium compounds can result in lung damage. In male rats and mice, exposure to uranium has been shown to decrease fertility. Uranium compounds on the skin caused skin irritation and mild skin damage in animals.

Health effects of natural and depleted uranium are due to chemical effects and not to radiation.

How likely is uranium to cause cancer?

Neither the National Toxicology Program (NTP), the International Agency for Research on Cancer (IARC) nor the EPA have classified natural uranium or depleted uranium with respect to carcinogenicity.

How can uranium affect children?

The health effects seen in children from exposure to toxic levels of uranium are expected to be similar to the effects seen in adults.

Exposure of animals to high levels of uranium during pregnancy, which caused toxicity in the mothers, has induced early deaths and birth defects in the young. It is not clear if this can happen in the absence of effects on the mother. We do not know whether uranium can cause birth defects in people. There are some studies that suggest that exposure to depleted uranium increased the frequency of birth defects, but the studies are deficient to allow valid conclusions.

How can families reduce the risk of exposure to uranium?

- Avoid eating root vegetables grown in soils with high levels of uranium. Consider washing fruits and vegetables grown in that soil and discard the outside portion of root vegetables.

- Consider having your water tested if you suspect that your drinking water might have elevated levels of uranium; if elevated levels are found, consider using bottled water.

Is there a medical test to determine whether I've been exposed to uranium?

Natural uranium is in your normal diet, so there will always be some level of uranium in all parts of your body. If depleted uranium is present, it adds to the total uranium level. Uranium can be measured in blood, urine, hair, and body tissues. Most tests are for total uranium; however, expensive tests are available to estimate the amounts of both natural and depleted uranium that are present.

Has the federal government made recommendations to protect human health?

The government has made recommendations for uranium which apply to natural and depleted uranium combined.

The EPA established a maximum drinking water contaminant level of 0.03 mg/L.

The Occupational Safety and Health Administration (OSHA) has limited workers' exposure in air to an average of 0.05 mg U/m³ for soluble uranium and 0.25 mg U/m³ for insoluble uranium over an 8-hour workday.

The National Institute for Occupational Safety and Health (NIOSH) recommends workers exposure be limited to 0.05 mg U/m³ of air for soluble uranium and 0.2 mg U/m³ for insoluble uranium averaged over a 10-hour workday and recommends that exposure to soluble uranium not exceed 0.6 mg U/m³ for more than 15 minutes.

The Nuclear Regulatory Commission (NRC) has established air concentration limits for uranium and its individual isotopes that apply to occupational exposure and releases from facilities.

RADIOACTIVE MATERIAL LICENSE

Pursuant to the Illinois Radiation Protection Act and the rules and regulations in 32 Illinois Administrative Code promulgated thereunder, and in reliance on statements and representations heretofore made by the licensee, a license is hereby issued authorizing the licensee to receive, acquire, own, possess and transfer radioactive material(s) listed herein; and to use such radioactive material(s) for the purpose(s) and at the place(s) designated below. This license is subject to all applicable rules, regulations and orders of the Agency now or hereafter in effect and to any conditions specified in the license.

City of Chicago Department of Assets and Information and Services (AIS) 30 North LaSalle St., Suite 300 Chicago, IL 60602	<u>LICENSEE</u> IL- 02467-01	<u>LICENSE NUMBER</u> January 31, 2021	<u>EXPIRATION DATE</u>
	<u>AMENDMENT NUMBER</u> 4		

Attention: Abby Mazza P.E.
Environmental Engineer III

In accordance with application dated 5-13-2015 and letters with attachments dated 5-28-2015 and 6-18-2015, License Number IL-02467-01 is established.

ITEM	RADIONUCLIDE	MAXIMUM ACTIVITY*		MAXIMUM POSSESSION	
		CHEMICAL and/or PHYSICAL FORM	PER SOURCE	LIMIT	
A.	Radium, Uranium, Thorium, and their daughters	As contamination from previous operations		Only the quantity present at the site	
B.	Radium, Uranium, Thorium and their daughters	As Environmental (air, soil, water) and wipe samples	Any	Any	

Agency Note: Manufacturers/Distributors must verify authenticity of license and maximum possession limits with the Illinois Emergency Management Agency, Bureau of Radiation Safety prior to shipment of radioactive material to this licensee.

AUTHORIZED USE:

- A. Except as specifically provided otherwise by the license, the licensee shall possess and use radioactive material described in all schedules of this license in accordance with statements, representations and procedures contained in, referenced in, or enclosed with the documents listed below for Site Decommissioning Plan and associated implementing documents.**
- B. For collection, possession, storage and transfer of samples incidental to site environmental monitoring and characterization act**

RADIOACTIVE MATERIAL LICENSE

<u>LICENSEE</u>	<u>LICENSE NUMBER</u>	<u>AMENDMENT NUMBER</u>	<u>EXPIRATION DATE</u>
City of Chicago	IL- 02467-01		January 31, 2021

CONDITIONS

1. Radioactive material listed in License Schedule Items A. and B. shall be stored only on the licensee's property at 434 East 26th Street, Chicago, Illinois, known as the Former Carnotite Reduction Company site and further described in accordance with statements, representations and procedures listed in other conditions of this license.
2. Radioactive material shall be used by, or under the supervision of the Radiation Safety Officer Glen Huber, CHP or individuals who have been trained in accordance with application dated May 13, 2015. The licensee shall maintain training records of all designated users.
3. License Responsibilities
 - A. The Radiation Safety Officer for this license is Glenn Huber, as designated by the Agent for the City of Chicago.
 - B. The Agent for the City of Chicago is Kimberly Worthington, P.E., Deputy Commissioner.
 - C. The Contact for the City of Chicago is Abby Mazza, P.E., Environmental Engineer III.
4. The Radiation Safety Officer may delegate certain duties to specified individuals provided that:
 - A. The licensee maintain, for a period of 5 years, records of all individuals designated by the Radiation Safety Officer to perform duties or meet regulatory requirements that would otherwise be required as a duty of the Radiation Safety Officer. These records shall include:
 1. The name of the individual;
 2. A list of all duties the Radiation Safety Officer's designee is authorized to perform;
 3. The date upon which the designation became effective;
 4. The signature of the Radiation Safety Officer's designee; and
 5. The signature of the Radiation Safety Officer.

- B. The Radiation Safety Officer shall review records generated by designees and the performance of designees quarterly. In addition, the licensee shall maintain for Agency inspection for a period of 5 years, records of the quarterly reviews of records generated by designees and quarterly reviews of designee's performance. These records shall include:
1. The date of the review;
 2. The records being reviewed and the name of the designee being reviewed;
 3. A list of all duties performed by the designee;
 4. The results of the Radiation Safety Officer's review and any corrective measures taken, if applicable, based on the review; and
 5. The signature of the Radiation Safety Officer.
5. Radioactive material authorized for use in License Schedule Item A shall be used in accordance with the following conditions:
- A. **The licensee shall not commence decommissioning activities until authorized in writing by the Agency.**
 - B. The installation of utilities to support environmental monitoring
 - C. The installation of groundwater monitoring wells
 - D. The maintenance of existing installed utilities
 - E. Any other activities as approved by the Agency with prior approval via memo or email.
6. The licensee has developed a plan and procedure for utility emergencies in impacted areas and shall continue to keep the Agency informed of significant activities in the vicinity of the site.
7. The licensee shall control entry to the licensed area, with the exception of the pedestrian/public right-of-way areas along 26th and 27th Street as shown on Figure 2 of the HASP, Rev 0, until the areas are released for unrestricted use. Items and surface contamination shall be decontaminated in

accordance with 32 Ill. Adm. Code 340. Appendix A. Failure to meet the stipulations of this Condition may result in termination of this authorization.

8. An environmental monitoring program, shall be implemented as soon as practicable after the issuance of this license. **Portions of this program were previously temporarily suspended. Those portions shall resume 30 days prior to initiation of invasive remedial decommissioning activities, including site mobilization. The environmental monitoring program shall consist of the following:**
 - A. Particulate sampling shall be performed as follows: 4 locations as specified in the May 13, 2015 application and further described in the May 28, 2015 Environmental Monitoring Plan. The method of collection shall be continuous. The frequency of filter change shall be weekly. Analysis shall be as outlined in the Environmental Monitoring Plan. These shall be reported in units of microcurie per milliliter (μCi/ml). A background location for this program was requested via letter on October 31, 2017.
 - B. Radon sampling shall be performed as follows: 10 locations as specified in the May 13, 2015 application and as described in the May 28, 2015 Environmental Monitoring Plan. The method of collection shall be continuous. The frequency of collection shall be quarterly. Sample analysis shall be quarterly by location.
 - C. Direct gamma radiation monitoring shall be performed as follows: 10 locations as specified in the May 13, 2015 application and as described in the May 28, 2015 Environmental Monitoring Plan. The method of collection shall be continuous. The frequency of collection shall be quarterly. Sample analysis shall be quarterly by location. During the quarterly collection, dose rate information shall be collected at each of these locations as requested. A background location for this program was requested via letter on October 31, 2017.
 - D. Water monitoring shall be performed as follows: Groundwater monitoring shall be conducted initially at 3 existing well locations. Additional locations may be added based on results. The frequency of collection shall be quarterly and the analysis shall be quarterly by location and as outlined in the Environmental Monitoring Plan. A background location for this program was requested via letter on October 31, 2017.
 - E. The Licensee shall conduct an evaluation of existing storm sewers and drainage systems and select two locations for storm sewer water sampling; said sampling will be conducted at the same time and frequency as groundwater sampling. Initially, sediments should also be collected from these same locations for a total of 4 quarters. **For the purposes of**

decommissioning, storm sewer and sediment sampling will only performed when requested by the Agency. A background location for this program was requested via letter on October 31, 2017.

- F. The Environmental Monitoring Program will generate quarterly data reports based on analytical results. These results should be shared with the Agency. An annual report of these compiled results and an analysis of trends should be submitted to the Agency within 120 days of the end of the 4th quarter.

The annual environmental monitoring report specified above, shall contain a section that includes the Annual Public Dose Evaluation as required by 32 Ill. Adm. Code 340.320.

9. The installation, initiation and implementation of the Environmental Monitoring Program shall comply with the Quality Assurance program.
10. The licensee shall use appropriately calibrated survey instruments for performing exposure rate surveys in accordance with 32 Ill. Adm. Code 332(b)(2). The gamma radiation shall be measured at a distance of 100 cm from the surface. For purposes of the survey, the background gamma radiation level is defined as 10 μ R/hr $\pm$ 4 μ R/hr.
11. For the purpose of radionuclide determinations in air samples from the Former Carnotite Reduction Site, any laboratory employed for this purpose shall use instrumentation and methodologies with lower limits of detection at or below 10% of the regulatory limits for the radiological parameters for which environmental air particulate samples are analyzed. Results indicating that a parameter is not detected shall be reported as "less than" the value of the corresponding lower limit of detection
12. The licensee shall ensure that background counts and operational efficiency checks are performed on radiation detection instrumentation used on the site. The background count and counting efficiency shall be performed daily or, if not used daily, prior to each use. The licensee shall calibrate the systems initially, at intervals not to exceed 12 months, and after each repair of the instrument. Counting efficiencies shall be determined using appropriate standards which are traceable to the National Institute of Standards and Technology (NIST). Records shall be maintained to document the system calibration, background determinations, and counting efficiency determinations.

19. Soil Remediation Criteria
 - a. For the purpose of the activities authorized by this amendment, the concentration of residual radium (radium 226) in dry soil, after removal of soil or other materials that are being relocated, shall not exceed 5 picocuries per gram (5 pCi/g) above background. Concentrations of radium in such residual soils shall be averaged over areas of 100 square meters and averaged over layers of 15 centimeters thickness. The soil concentration of 5 pCi/g is deemed necessary to ensure that the licensee will meet the requirements of 32 Ill. Adm. Code, sections 340.110(b) and 330.325 to maintain doses to the public and releases to the general environment as low as is reasonably achievable (ALARA). A case by case demonstration that particular circumstances do not require cleanup to the above-stated goal will be considered.
 - b. For the purpose of the activities authorized by this amendment, the concentration of total residual uranium in dry soil, after removal of soil or other materials that are being relocated, shall not exceed 20 picocuries per gram (20 pCi/g) above background to a depth of 5 meters and 50 picocuries per gram (50 pCi/g) for all other depths. Concentrations of uranium in such residual soils shall be averaged over areas of 100 square meters and averaged over layers of 15 centimeters thickness. The soil concentration of 20 pCi/g to a depth of 5 meters and 50 pCi/g for all other depths is deemed necessary to ensure that the licensee will meet the requirements of 32 Ill. Adm. Code, sections 340.110(b) and 330.325 to maintain doses to the public and

releases to the general environment as low as is reasonably achievable (ALARA). A case by case demonstration that particular circumstances do not require cleanup to the above-stated goal will be considered.

- c. For the purpose of the activities authorized by this amendment, the concentration of residual thorium (Th-230) in dry soil, after removal of soil or other materials that are being relocated, shall not exceed 5 picocuries per gram (5 pCi/g) above background. Concentrations of thorium in such residual soils shall be averaged over areas of 100 square meters and averaged over layers of 15 centimeters thickness. The soil concentration of 5 pCi/g is deemed necessary to ensure that the licensee will meet the requirements of 32 Ill. Adm. Code, sections 340.110(b) and 330.325 to maintain doses to the public and releases to the general environment as low as is reasonably achievable (ALARA). A case by case demonstration that particular circumstances do not require cleanup to the above-stated goal will be considered.
- d. Background concentrations for the aforementioned radionuclides shall be determined either via utilization of established local background concentrations from other projects, or via an approved background sampling activity.

- 20. The RSO shall order all outdoor contaminated waste handling operations (e.g., excavation or loading of trucks) to cease in the event of adverse weather (e.g., sustained winds exceeding 20 miles/hour averaged over a 10 minute period or rainfall exceeding 0.25 inch/hour). In addition, any time visible dust is observed at the Site, the RSO shall take actions within 20 minutes to stop the generation of visible dust.**
- 21. The licensee shall provide two (2) copies of the dust control plan and QA/QC plan required for each contractor in the contract specifications to IEMA prior to commencement of decommissioning activities.**
- 22. The licensee shall ensure, for the purposes of dust control, that each truck hauling contaminated soil has either: a soil moisture content that is sufficient to prevent visible dust generation; the soil on the top of the load is wet before transporting it; or the contents are covered. In addition, all outdoor, stockpiled, contaminated material at the Site shall be covered with geomembranes, or other approved alternate cover material.**
- 23. All above grade, outdoor, stockpiles and associated exposed faces of contaminated materials shall be fully covered with geomembranes or approved alternate cover material, when activities using the materials are completed for the day.**

24. The licensee shall perform occupational air monitoring while engaged in the following activities: when digging in contaminated soil, managing contaminated material stockpiles, and loading waste for shipment.
25. Interfaces between clean backfill and contaminated material (which is to be excavated at a later date, if any) shall be identified and synthetic or natural barriers shall be placed at these interfaces to prevent contamination of clean backfill material.
26. Radiological analysis of water discharged off site from any water treatment system shall be performed as described in the Decommissioning Plan and associated implementing procedures
27. All accessible areas of *clean areas* shall be surveyed for contamination on at least a weekly frequency. If contamination in excess of the limits specified in 32 Ill. Adm. Code 340 Appendix A is detected, the licensee shall decontaminate the area to the specified limits.
28. Except as specifically provided otherwise by the license, the licensee shall possess and use radioactive material described in all schedules of this license in accordance with statements, representations and procedures contained in, referenced in, or enclosed with the documents listed below. The regulations contained in 32 Ill. Adm. Code: Chapter II, Subchapters b and d shall govern unless the statements, representations and procedures in the licensee's application and correspondence are more restrictive than the regulations. The most recent statements, representations and procedures listed below shall govern if they conflict with previously submitted documents.
- A. Application, with attachments, dated May 13, 2015.

Chicago, IL

**Re: Geotechnical Engineering Services
Former Carnotite Reduction Company Site – Excavation Plan
Chicago, Illinois**

Dear Ms. Schnoes,

GSG Consultants, Inc. (GSG) is pleased to provide Geotechnical Engineering Services for the Former Carnotite Reduction Company Site in Chicago, Illinois. The site investigation completed for the Sheet Pile Wall Design Geotechnical Investigation Report (January 25, 2019) for the proposed site was completed by GSG in January 2019.

The proposed Excavation Plans for soil removal at the site were completed per City of Chicago OUC requirements showing excavations with minimum slopes of 1.5H:1V for all excavations. Tetra Tech requested GSG evaluate and analyze the potential for slope excavations at this site, in order to minimize the excavations on site.

Engineering Analysis

GSG reviewed the geotechnical design reports, and proposed construction drawings in order to provide geotechnical analysis and recommendations for slope stability calculations in accordance with City of Chicago OUC requirements.

GSG used Slide 8.0 to analyze the stability based on the anticipated grading and the soils encountered while drilling. Slide 8.0 is a comprehensive slope stability analysis software used to evaluate the proposed excavation slopes for the project based on the limit equilibrium method. The analysis was evaluated using the Simplified Bishop Method– long term (drained) failure envelopes. The analyses for the excavation slopes was performed for Cross Sections A-A, C-C,

and D-D for differing anticipated depths of the excavations. The results of the slope models are provided in Attachments 1 through 3.

Attachments 1 through 3 contains a copy of the hand calculations for the global slope stability analysis of the excavations based on recommended slopes and soil conditions in accordance with OSHA requirements. The hand analysis was completed using the Method of Slices to confirm the analysis completed using the Slide software.

Conclusions

Based on the analyses completed, it is recommended that the slope excavations for excavations of up to 15 feet (Section A-A, B-B) may be completed at a 2.5H:1V side slope. The long term analysis resulted in global factor of safety of **1.7** using the simplified Bishop Method which was confirmed with hand calculations utilizing the Ordinary Method of Slices.

For excavations 7.5 feet (Section D-D) or less in depth, a side slope of 2H:1V may be completed. The long term analysis resulted in a global factor of safety of **1.7** using the simplified Bishop Method and confirmed with hand calculations utilizing the Ordinary Method of Slices.

For excavations 5 feet (Section C-C) or less in depth, a side slope of 1.5H:1V may be completed. The long term analysis resulted in a global factor of safety of **1.7** using the simplified Bishop Method and confirmed with hand calculations utilizing the Ordinary Method of Slices.

GSG appreciates the opportunity to submit this proposal for your consideration. We are looking forward to working with you on this project. Should you have any questions regarding our proposal, please call us at (312) 733-6262.

Sincerely,

GSG CONSULTANTS, INC.

Matthew J. Chipko, P.E.

Attachment 1

Slope Stability Exhibits
15-Foot Excavations
Section A-A

Exhibits and Hand Calculations

Problem Statement:

Estimate the allowable factor of safety for global stability for utility excavation – Section A-A – from GSG Excavation Plan for OUC. Calculation is for the long-term drained condition and is based on the soil conditions present at the site, which generally consist of OSHA Type C soils that require a minimum excavation slope of 1.5H:1V, however, for the excavations on this site in the area of Section A-A less than 15 feet, can be considered with a 2.5H:1V slopes.

Approach and References:

1. Ordinary Method of Slices – see attached exhibit
2. Excavation Plan & Cross Sections

Definitions:

B = Width of slice

H = Average height of slice

A = Area of slice

α = Angle of failure surface

W = Weight of slice

σ_w = Average pore pressure of slice

U = Normal component of pore pressure

N' = Effective normal force

c = drained shear strength or cohesion

γ = total unit weight

ϕ = drained friction angle

Assumed Soil Parameters – Drained Condition:

Depth (ft)	Soil Description	c (psf)	γ (pcf)	ϕ (degrees)
0-6	Black Sand Fill	c1 = 0	$\gamma_1 = 125$	30
6-19	Loose to Med. Dense, Br/Gr Sand	c2 = 0	$\gamma_2 = 122$	34
19-33	Loose to Med. Dense, Gr Sand	c3 = 0	$\gamma_3 = 119$	32

Given:

Depth of long term water table = 19 feet (below max c' variations)

Maximum excavation depth – 15 feet

Slide slopes (max per OSHA soil type) – 2.5H:1V

- Effective Stress Analysis (ESA)

$$FS = \frac{\sum \{c'l + [(W/b) \cos \alpha - ul] \tan \phi'\}}{\sum [(W/b) \sin \alpha]}$$

Calculations: Example of driving and resistance forces for Slice 1

Slices 1 through 10 include the resisting forces contributed through the soil adjacent to the failure surface friction angle and cohesive forces for all slices

Slice 1 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 1A: } B \text{ (ft)} = 3.5 \text{ ft}$$

$$H \text{ (ft)} = 0.75 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = (0.75 \text{ ft} * 3.5 \text{ ft}) / 2 = 1.31 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -31.6 \text{ degrees}$$

$$\text{Sin}(-31.6 \text{ deg}) = -0.52$$

$$\text{Cos}(-31.6 \text{ deg}) = 0.85$$

$$\text{Sec}(-31.6 \text{ deg}) = 1.18$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (1.31 \text{ ft}^2 * 125 \text{ pcf}) = 164.1 \text{ lb/ft}$$

$$W * \sin(\alpha) = 164.1 \text{ lb/ft} * -0.52 = 85.3 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 164.1 \text{ lb/ft} * 0.85 = 139.5 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (164.1 \text{ lb/ft} * 0.85) - 0 \text{ lb/ft} = 139.5 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 139.5 \text{ lb/ft} * 0.58 = 79.5 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 3.5 * 1.18 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 2

Slice 2 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 2A: } B \text{ (ft)} = 3.5 \text{ ft}$$

$$H \text{ (ft)} = 1.30 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(1.3 \text{ ft} + 0.75 \text{ ft}) / 2] * 3.5 \text{ ft} = 3.59 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -29.4 \text{ degrees}$$

$$\text{Sin}(-29.4 \text{ deg}) = -0.52$$

$$\text{Cos}(-29.4 \text{ deg}) = 0.87$$

$$\text{Sec}(-29.4 \text{ deg}) = 1.15$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (3.59 \text{ ft}^2 * 125 \text{ pcf}) = 448.4 \text{ lb/ft}$$

$$W * \sin(\alpha) = 448.4 \text{ lb/ft} * -0.52 = 219.7 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 448.4 \text{ lb/ft} * 0.87 = 390.1 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (448.4 \text{ lb/ft} * 0.87) - 0 \text{ lb/ft} = 390.1 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 390.1 \text{ lb/ft} * 0.58 = 222.4 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 3.5 * 1.15 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 3

Slice 3 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 3A: } B \text{ (ft)} = 3.25 \text{ ft}$$

$$H \text{ (ft)} = 1.7 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(1.7 \text{ ft} + 1.3 \text{ ft}) / 2] * 3.25 \text{ ft} = 4.88 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -27.4 \text{ degrees}$$

$$\text{Sin}(-27.4 \text{ deg}) = -0.46$$

$$\text{Cos}(-27.4 \text{ deg}) = 0.89$$

$$\text{Sec}(-27.4 \text{ deg}) = 1.12$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (4.88 \text{ ft}^2 * 125 \text{ pcf}) = 609.4 \text{ lb/ft}$$

$$W * \sin(\alpha) = 609.4 \text{ lb/ft} * -0.46 = 280.3 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 609.4 \text{ lb/ft} * 0.89 = 542.3 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (609.4 \text{ lb/ft} * 0.89) - 0 \text{ lb/ft} = 542.3 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 542.3 \text{ lb/ft} * 0.58 = 309.1 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 3.25 * 1.12 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 4

Slice 4 exists in one (1) soil type that will be designated as follows: 4A) Black sand fill and 4B) Brown and Gray Sand

Slice 4A: B (ft) = 3.75 ft

H (ft) = 1.7 ft

$A_1 \text{ (ft}^2\text{)} = [(1.7 \text{ ft} + 1.7 \text{ ft}) / 2] * 3.75 \text{ ft} = 3.19 \text{ ft}^2$

Slice 4B: B (ft) = 3.75 ft

H (ft) = 1.80 ft

$A_1 \text{ (ft}^2\text{)} = (1.8 \text{ ft} * 3.75 \text{ ft}) / 2 = 3.38 \text{ ft}^2$

Alpha (α) = -25.1 degrees

Sin(-25.1 deg) = -0.42

Cos(-25.1 deg) = 0.91

Sec(-25.1 deg) = 1.10

$W \text{ (lb/ft)} = A_1 \gamma_1 + A_2 \gamma_2 = (3.19 \text{ ft}^2 * 125 \text{ pcf}) + (3.38 \text{ ft}^2 * 122 \text{ pcf}) = 810.2 \text{ lb/ft}$

$W * \sin(\alpha) = 810.2 \text{ lb/ft} * -0.42 = 340.3 \text{ lb/ft}$ (driving)

$W * \cos(\alpha) = 810.2 \text{ lb/ft} * 0.91 = 737.3 \text{ lb/ft}$

$N' = (W * \cos(\alpha)) - U = (810.2 \text{ lb/ft} * 0.91) - 0 \text{ lb/ft} = 737.3 \text{ lb/ft}$

$\tan(\varphi) = \tan(34 \text{ deg}) = 0.67$

$N' * \tan(\varphi) = 737.3 \text{ lb/ft} * 0.67 = 494 \text{ lb/ft}$ (resisting)

$c * B * \sec(\alpha) = 0 \text{ psf} * 3.75 * 1.10 = 0 \text{ lb/ft}$ (resisting)

Calculations: Example of driving and resistance forces for Slice 5

Slice 5 exists in one (1) soil type that will be designated as follows: 5A) Br/gr sand

$$\text{Slice 5A: } B \text{ (ft)} = 3.75 \text{ ft}$$

$$H \text{ (ft)} = 2.0 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(2.0 \text{ ft} + 1.7 \text{ ft}) / 2] * 3.75 \text{ ft} = 7.13 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -22.8 \text{ degrees}$$

$$\text{Sin}(-22.8 \text{ deg}) = -0.39$$

$$\text{Cos}(-22.8 \text{ deg}) = 0.92$$

$$\text{Sec}(-22.8 \text{ deg}) = 1.09$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (7.13 \text{ ft}^2 * 122 \text{ pcf}) = 869.3 \text{ lb/ft}$$

$$W * \sin(\alpha) = 869.3 \text{ lb/ft} * -0.39 = 339 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 869.3 \text{ lb/ft} * 0.92 = 799.7 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (869.3 \text{ lb/ft} * 0.92) - 0 \text{ lb/ft} = 799.7 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(34 \text{ deg}) = 0.67$$

$$N' * \tan(\varphi) = 799.7 \text{ lb/ft} * 0.67 = 535.8 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 3.75 * 1.09 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 6

Slice 5 exists in one (1) soil type that will be designated as follows: 6A) Br/gr sand

$$\text{Slice 6A: } B \text{ (ft)} = 3.75 \text{ ft}$$

$$H \text{ (ft)} = 1.9 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(1.9 \text{ ft} + 2.0 \text{ ft}) / 2] * 3.75 \text{ ft} = 7.31 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -20.6 \text{ degrees}$$

$$\text{Sin}(-20.6 \text{ deg}) = -0.35$$

$$\text{Cos}(-20.6 \text{ deg}) = 0.94$$

$$\text{Sec}(-20.6 \text{ deg}) = 1.06$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (7.31 \text{ ft}^2 * 122 \text{ pcf}) = 892.1 \text{ lb/ft}$$

$$W * \sin(\alpha) = 892.1 \text{ lb/ft} * -0.35 = 312.2 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 892.1 \text{ lb/ft} * 0.94 = 838.6 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (892.1 \text{ lb/ft} * 0.94) - 0 \text{ lb/ft} = 838.6 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(34 \text{ deg}) = 0.67$$

$$N' * \tan(\varphi) = 838.6 \text{ lb/ft} * 0.67 = 561.9 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 3.75 * 1.06 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 7

Slice 7 exists in one (1) soil type that will be designated as follows: 7A) Br/gr sand

$$\text{Slice 7A: } B \text{ (ft)} = 3.75 \text{ ft}$$

$$H \text{ (ft)} = 1.7 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(1.7 \text{ ft} + 1.9 \text{ ft}) / 2] * 3.75 \text{ ft} = 6.75 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -18.4 \text{ degrees}$$

$$\text{Sin}(-18.4 \text{ deg}) = -0.32$$

$$\text{Cos}(-18.4 \text{ deg}) = 0.95$$

$$\text{Sec}(-18.4 \text{ deg}) = 1.05$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (6.75 \text{ ft}^2 * 122 \text{ pcf}) = 823.5 \text{ lb/ft}$$

$$W * \sin(\alpha) = 823.5 \text{ lb/ft} * -0.32 = 263.5 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 823.5 \text{ lb/ft} * 0.95 = 782.3 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (823.5 \text{ lb/ft} * 0.95) - 0 \text{ lb/ft} = 782.3 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(34 \text{ deg}) = 0.67$$

$$N' * \tan(\varphi) = 782.3 \text{ lb/ft} * 0.67 = 524.2 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 3.75 * 1.05 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 8

Slice 8 exists in one (1) soil type that will be designated as follows: 8A) Br/gr sand

$$\text{Slice 8A: } B \text{ (ft)} = 3.5 \text{ ft}$$

$$H \text{ (ft)} = 1.3 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(1.3 \text{ ft} + 1.7 \text{ ft}) / 2] * 3.5 \text{ ft} = 5.25 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -16.2 \text{ degrees}$$

$$\text{Sin}(-16.2 \text{ deg}) = -0.28$$

$$\text{Cos}(-16.2 \text{ deg}) = 0.96$$

$$\text{Sec}(-16.2 \text{ deg}) = 1.04$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (5.25 \text{ ft}^2 * 122 \text{ pcf}) = 640.5 \text{ lb/ft}$$

$$W * \sin(\alpha) = 640.5 \text{ lb/ft} * -0.28 = 179.3 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 640.5 \text{ lb/ft} * 0.96 = 614.9 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (640.5 \text{ lb/ft} * 0.96) - 0 \text{ lb/ft} = 614.9 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(34 \text{ deg}) = 0.67$$

$$N' * \tan(\varphi) = 614.9 \text{ lb/ft} * 0.67 = 414.4 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 3.5 * 1.04 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 9

Slice 9 exists in one (1) soil type that will be designated as follows: 9A) Br/gr sand

$$\text{Slice 9A: } B \text{ (ft)} = 4.0 \text{ ft}$$

$$H \text{ (ft)} = 0.7 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(0.7 \text{ ft} + 1.3 \text{ ft}) / 2] * 4.0 \text{ ft} = 4.0 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -14.1 \text{ degrees}$$

$$\text{Sin}(-14.1 \text{ deg}) = -0.24$$

$$\text{Cos}(-14.1 \text{ deg}) = 0.97$$

$$\text{Sec}(-14.1 \text{ deg}) = 1.03$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (4 \text{ ft}^2 * 122 \text{ pcf}) = 488 \text{ lb/ft}$$

$$W * \sin(\alpha) = 488 \text{ lb/ft} * -0.24 = 117.1 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 488 \text{ lb/ft} * 0.97 = 473.4 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (488 \text{ lb/ft} * 0.97) - 0 \text{ lb/ft} = 473.4 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(34 \text{ deg}) = 0.67$$

$$N' * \tan(\varphi) = 473.4 \text{ lb/ft} * 0.67 = 317.2 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 4.0 * 1.03 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 10

Slice 10 exists in one (1) soil type that will be designated as follows: 1A) Br/Gr Sand

$$\text{Slice 10A: } B \text{ (ft)} = 3.75 \text{ ft}$$

$$H \text{ (ft)} = 0.7 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = (0.7 \text{ ft} * 3.75 \text{ ft}) / 2 = 1.31 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -1.9 \text{ degrees}$$

$$\text{Sin}(-1.9 \text{ deg}) = -0.03$$

$$\text{Cos}(-1.9 \text{ deg}) = 1.0$$

$$\text{Sec}(-1.9 \text{ deg}) = 1.0$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (1.31 \text{ ft}^2 * 122 \text{ pcf}) = 160.1 \text{ lb/ft}$$

$$W * \sin(\alpha) = 160.1 \text{ lb/ft} * -0.03 = 4.8 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 160.1 \text{ lb/ft} * 1.0 = 160.1 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (160.1 \text{ lb/ft} * 1.0) - 0 \text{ lb/ft} = 160.1 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(34 \text{ deg}) = 0.67$$

$$N' * \tan(\varphi) = 160.1 \text{ lb/ft} * 0.67 = 107.3 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 3.75 * 1.0 = 0 \text{ lb/ft (resisting)}$$

Total sum of resisting forces:

Summation of resisting forces due to friction angle forces

$$= 79.5 + 222.4 + 309.1 + 494 + 535.8 + 561.9 + 524.2 + 414.4 + 317.2 + 107.3 = 3565.7 \text{ lb/ft}$$

Summation of resisting forces due to cohesion forces

$$= 0 \text{ lb/ft}$$

$$\text{Summation of all resisting forces} = 3565.7 \text{ lb/ft} + 0 \text{ lb/ft} = 3565.7 \text{ lb/ft}$$

Total sum of driving forces:

Total driving forces

$$= 85.3 + 219.7 + 280.3 + 340.3 + 339 + 312.2 + 263.5 + 179.3 + 117.1 + 4.8 = 2141.7 \text{ lb/ft}$$

Results:

$$\text{Factor of Safety} = \frac{\text{sum of resisting forces}}{\text{Sum of driving forces}} = \frac{3565.7}{2141.7} = 1.70$$

Driving Forces are equal to the summation of the weights of slices 1 through 10

Resistance Forces are equal to the summation of the shear forces (i.e. cohesion/friction) along the failure surface

See attached spreadsheet for complete list of slice calculations and attached Slope 7.0 model of global stability analyses. Based on hand calculation, the factor of safety against failure is 1.7, consistent with the Slope 7.0 software.

Conclusion:

The above factor of safety, which was computed by using the method of slices for a 2.5H:1V slope at Section A-A for excavations 15 feet or less, is consistent with the factors of safety computed via Slope 7.0 which utilized the Simplified Bishop and Janbu methods. The computer models calculated factor of safety values for this scenario of 1.5 (Bishop), which satisfy the minimum design factor of safety for slope stability of 1.5.

OSHA Excavation Slopes:

The contractor will be responsible to provide a safe excavation during the construction activities of the project. All excavations should be conducted in accordance with applicable federal, state, and local safety regulations, including, but not limited to the Occupational Safety and Health Administration (OSHA) excavation safety standards. In accordance with OSHA Regulation 29 CFR 1926 Subpart P Appendix B, the maximum allowable slopes for excavations less than 20 feet should be completed per the OSHA Excavation Slopes shown in Table 1. Excavations made in layered soil systems shall use the maximum allowable slope for each layer as prescribed in the OSHA Regulation. Excavations greater than 20 feet deep should be designed by a registered professional engineer; any shoring or bracing systems should be designed by a licensed structural engineer.

Table 1 – OSHA Excavation Slopes

Soil or Rock Type	Maximum Allowable Slope (H:V) for less than 20 feet
Stable Rock	Vertical (90°)
Type A ¹	¾:1 (53 °)
Type B ²	1:1 (45 °)
Type C ³	1 ½:1 (34 °)

¹ Type A Soils are cohesive soils with an unconfined compressive strength of 1.5 tons per square foot (tsf) or greater.

² Type B Soils are cohesive soils with an unconfined compressive strength greater than 0.5 tsf but less than 1.5 tsf, and includes angular gravel.

³ Type C Soils are cohesive soils with an unconfined compressive strength of 0.5 tsf or less, as well as cohesionless soils.

Excavation stability and soil pressures on temporary shoring are dependent on soil conditions, depth of excavations, installation procedures, and the magnitude of any surcharge loads on the ground surface adjacent to the excavation. Surcharge loads from the excavated materials, construction equipment, and vehicles should be included in the design of the excavation system. Excavation near existing structures and underground utilities should be performed with extreme care to avoid undermining existing structures.

Carnotite Open Cut- 15 ft Excavation

Project Summary

Slide Modeler Version: 8.026
Compute Time: 00h:00m:00.484s

General Settings

Units of Measurement: Imperial Units
Time Units: days
Permeability Units: feet/second
Data Output: Standard
Failure Direction: Left to Right

Analysis Options

Slices Type: Vertical

Analysis Methods Used

Bishop simplified
Janbu simplified

Number of slices: 10
Tolerance: 0.005
Maximum number of iterations: 50
Check $m_{\alpha} < 0.2$: Yes
Initial trial value of FS: 1
Steffensen Iteration: Yes

Groundwater Analysis

Groundwater Method: Water Surfaces
Pore Fluid Unit Weight [lbs/ft³]: 62.4
Use negative pore pressure cutoff: Yes
Maximum negative pore pressure [psf]: 0
Advanced Groundwater Method: None

Random Numbers

Pseudo-random Seed: 10116
Random Number Generation Method: Park and Miller v.3

Surface Options

Surface Type: Circular
 Search Method: Grid Search
 Radius Increment: 10
 Composite Surfaces: Disabled
 Reverse Curvature: Invalid Surfaces
 Minimum Elevation: Not Defined
 Minimum Depth: Not Defined
 Minimum Area: Not Defined
 Minimum Weight: Not Defined

Seismic Loading

Advanced seismic analysis: No
 Staged pseudostatic analysis: No

 Error Code -109 reported for 7 surfaces
 Error Code -111 reported for 1 surface
 Error Code -118 reported for 788 surfaces

Error Codes

The following errors were encountered during the computation:

- 107 = Total driving moment or total driving force is negative. This will occur if the wrong failure direction is specified, or if high external or anchor loads are applied against the failure direction.
- 108 = Total driving moment or total driving force < 0.1 . This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
- 109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region, even though the slip surface is wholly within the soil region.
- 111 = safety factor equation did not converge
- 118 = Surface does not pass through the search focus

Slope Stability Exhibits
5-Foot Excavations
Section C-C

Exhibits and Hand Calculations

Problem Statement:

Estimate the allowable factor of safety for global stability for utility excavation – Section C-C – from GSG Excavation Plan for OUC. Calculation is for the long-term drained condition and is based on the soil conditions present at the site, which generally consist of OSHA Type C soils that require a minimum excavation slope of 1.5H:1V.

Approach and References:

1. Ordinary Method of Slices – see attached exhibit
2. Excavation Plan & Cross Sections

Definitions:

B = Width of slice

H = Average height of slice

A = Area of slice

α = Angle of failure surface

W = Weight of slice

σ_w = Average pore pressure of slice

U = Normal component of pore pressure

N' = Effective normal force

c = drained shear strength or cohesion

γ = total unit weight

ϕ = drained friction angle

Assumed Soil Parameters – Drained Condition:

Depth (ft)	Soil Description	c (psf)	γ (pcf)	ϕ (degrees)
0-6	Black Sand Fill	c1 = 0	γ_1 = 125	30
6-19	Loose to Med. Dense, Br/Gr Sand	c2 = 0	γ_2 = 122	34
19-33	Loose to Med. Dense, Gr Sand	c3 = 0	γ_3 = 119	32

Given:

Depth of long term water table = 119 feet (below max depth of excavations)

Maximum excavation depth – 5 feet

Slide slopes (max per OSHA soil type) – 1.5H:1V

- Effective Stress Analysis (ESA)

$$FS = \frac{\sum \{c'l + [(W/b) \cos \alpha - ul] \tan \phi'\}}{\sum [(W/b) \sin \alpha]}$$

Calculations: Example of driving and resistance forces for Slice 1

Slices 1 through 10 include the resisting forces contributed through the soil adjacent to the failure surface friction angle and cohesive forces for all slices

Slice 1 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 1A: } B \text{ (ft)} = 1.5 \text{ ft}$$

$$H \text{ (ft)} = 1.6 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = (1.5 \text{ ft} * 1.6 \text{ ft}) / 2 = 1.2 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -43.4 \text{ degrees}$$

$$\sin(-43.4 \text{ deg}) = -0.69$$

$$\cos(-43.4 \text{ deg}) = 0.73$$

$$\sec(-43.4 \text{ deg}) = 1.37$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (1.2 \text{ ft}^2 * 125 \text{ pcf}) = 150 \text{ lb/ft}$$

$$W * \sin(\alpha) = 150 \text{ lb/ft} * -0.69 = 103.5 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 150 \text{ lb/ft} * 0.73 = 109.5 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (150 \text{ lb/ft} * 0.73) - 0 \text{ lb/ft} = 109.5 \text{ lb/ft}$$

$$\tan(\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 109.5 \text{ lb/ft} * 0.58 = 62.4 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 1.5 * 1.37 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 2

Slice 2 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 1A: } B \text{ (ft)} = 1.75 \text{ ft}$$

$$H \text{ (ft)} = 2.8 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(1.6 \text{ ft} + 2.8 \text{ ft}) / 2] * 1.75 \text{ ft} = 3.85 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -36.1 \text{ degrees}$$

$$\text{Sin}(-36.1 \text{ deg}) = -0.59$$

$$\text{Cos}(-36.1 \text{ deg}) = 0.81$$

$$\text{Sec}(-36.1 \text{ deg}) = 1.23$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (3.85 \text{ ft}^2 * 125 \text{ pcf}) = 481.3 \text{ lb/ft}$$

$$W * \sin(\alpha) = 481.3 \text{ lb/ft} * -0.59 = 283.9 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 481.3 \text{ lb/ft} * 0.81 = 389.8 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (481.3 \text{ lb/ft} * 0.81) - 0 \text{ lb/ft} = 389.9 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 389.9 \text{ lb/ft} * 0.58 = 222.2 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 1.75 * 1.23 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 3

Slice 3 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 1A: } B \text{ (ft)} = 1.75 \text{ ft}$$

$$H \text{ (ft)} = 3.7 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(2.8 \text{ ft} + 3.7 \text{ ft}) / 2] * 1.75 \text{ ft} = 5.69 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -29.5 \text{ degrees}$$

$$\sin(-29.5 \text{ deg}) = -0.49$$

$$\cos(-29.5 \text{ deg}) = 0.87$$

$$\sec(-29.5 \text{ deg}) = 1.15$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (5.69 \text{ ft}^2 * 125 \text{ pcf}) = 710.9 \text{ lb/ft}$$

$$W * \sin(\alpha) = 710.9 \text{ lb/ft} * -0.49 = 348.4 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 710.9 \text{ lb/ft} * 0.87 = 618.5 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (618.5 \text{ lb/ft} * 0.87) - 0 \text{ lb/ft} = 618.5 \text{ lb/ft}$$

$$\tan(\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 618.5 \text{ lb/ft} * 0.58 = 352.6 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 1.75 * 1.15 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 4

Slice 4 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 4A: } B \text{ (ft)} = 1.5 \text{ ft}$$

$$H \text{ (ft)} = 4.1 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(3.7 \text{ ft} + 4.1 \text{ ft}) / 2] * 1.5 \text{ ft} = 5.85 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -23.3 \text{ degrees}$$

$$\text{Sin}(-23.3 \text{ deg}) = -0.4$$

$$\text{Cos}(-23.3 \text{ deg}) = 0.92$$

$$\text{Sec}(-23.3 \text{ deg}) = 1.09$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (5.85 \text{ ft}^2 * 125 \text{ pcf}) = 731.3 \text{ lb/ft}$$

$$W * \sin(\alpha) = 731.3 \text{ lb/ft} * -0.4 = 292.5 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 731.3 \text{ lb/ft} * 0.92 = 672.8 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (672.8 \text{ lb/ft} * 0.92) - 0 \text{ lb/ft} = 672.8 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 672.8 \text{ lb/ft} * 0.58 = 390.2 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 1.5 * 1.09 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 5

Slice 5 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 5A: } B \text{ (ft)} = 1.5 \text{ ft}$$

$$H \text{ (ft)} = 3.5 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(4.1 \text{ ft} + 3.5 \text{ ft}) / 2] * 1.5 \text{ ft} = 5.7 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -17.4 \text{ degrees}$$

$$\sin(-17.4 \text{ deg}) = -0.3$$

$$\cos(-17.4 \text{ deg}) = 0.95$$

$$\sec(-17.4 \text{ deg}) = 1.05$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (5.7 \text{ ft}^2 * 125 \text{ pcf}) = 712.5 \text{ lb/ft}$$

$$W * \sin(\alpha) = 712.5 \text{ lb/ft} * -0.3 = 213.8 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 712.5 \text{ lb/ft} * 0.95 = 676.9 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (712.5 \text{ lb/ft} * 0.95) - 0 \text{ lb/ft} = 676.9 \text{ lb/ft}$$

$$\tan(\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 676.9 \text{ lb/ft} * 0.58 = 406.1 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 1.5 * 1.05 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 6

Slice 6 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 6A: } B \text{ (ft)} = 1.75 \text{ ft}$$

$$H \text{ (ft)} = 2.75 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(2.75 \text{ ft} + 3.5 \text{ ft}) / 2] * 1.75 \text{ ft} = 5.47 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -11.7 \text{ degrees}$$

$$\text{Sin}(-11.7 \text{ deg}) = -0.2$$

$$\text{Cos}(-11.7 \text{ deg}) = 0.98$$

$$\text{Sec}(-11.7 \text{ deg}) = 1.02$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (5.47 \text{ ft}^2 * 125 \text{ pcf}) = 683.6 \text{ lb/ft}$$

$$W * \sin(\alpha) = 683.6 \text{ lb/ft} * -0.2 = 136.7 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 683.6 \text{ lb/ft} * 0.98 = 669.9 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (669.9 \text{ lb/ft} * 0.98) - 0 \text{ lb/ft} = 669.9 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 669.9 \text{ lb/ft} * 0.58 = 402 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 1.75 * 1.02 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 7

Slice 7 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 1A: } B \text{ (ft)} = 1.5 \text{ ft}$$

$$H \text{ (ft)} = 1.8 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(3.5 \text{ ft} + 1.8 \text{ ft}) / 2] * 1.5 \text{ ft} = 3.41 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -6.1 \text{ degrees}$$

$$\text{Sin}(-6.1 \text{ deg}) = -0.11$$

$$\text{Cos}(-6.1 \text{ deg}) = 0.99$$

$$\text{Sec}(-6.1 \text{ deg}) = 1.01$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (3.41 \text{ ft}^2 * 125 \text{ pcf}) = 426.6 \text{ lb/ft}$$

$$W * \sin(\alpha) = 426.6 \text{ lb/ft} * -0.11 = 46.9 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 426.6 \text{ lb/ft} * 0.99 = 422.3 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (426.6 \text{ lb/ft} * 0.99) - 0 \text{ lb/ft} = 422.3 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 422.3 \text{ lb/ft} * 0.58 = 253.4 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 1.5 * 1.01 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 8

Slice 8 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 8A: } B \text{ (ft)} = 1.75 \text{ ft}$$

$$H \text{ (ft)} = 0.75 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(1.8 \text{ ft} + 0.75 \text{ ft}) / 2] * 1.75 \text{ ft} = 2.23 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -0.5 \text{ degrees}$$

$$\text{Sin}(-0.5 \text{ deg}) = -0.01$$

$$\text{Cos}(-0.5 \text{ deg}) = 1.0$$

$$\text{Sec}(-0.5 \text{ deg}) = 1.0$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (2.23 \text{ ft}^2 * 125 \text{ pcf}) = 278.9 \text{ lb/ft}$$

$$W * \sin(\alpha) = 278.9 \text{ lb/ft} * -0.01 = 2.8 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 278.9 \text{ lb/ft} * 1 = 278.9 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (278.9 \text{ lb/ft} * 1) - 0 \text{ lb/ft} = 278.9 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 278.9 \text{ lb/ft} * 0.58 = 167.3 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 1.75 * 1.0 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 9

Slice 9 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

Slice 9A: B (ft) = 1.75 ft

H (ft) = 0.30 ft

$A_1 \text{ (ft}^2\text{)} = (1.75 \text{ ft} * 0.3 \text{ ft}) / 2 = 0.26 \text{ ft}^2$

Slice 9B: B (ft) = 1.75 ft

H (ft) = 0.3 ft

$A_2 \text{ (ft}^2\text{)} = [(0.31 \text{ ft} + 0.3 \text{ ft}) / 2] * 1.75 \text{ ft} = 0.53 \text{ ft}^2$

Alpha (α) = 5.0 degrees

Sin(5.0 deg) = 0.09

Cos(5.0 deg) = 1.0

Sec(5.0 deg) = 1.02

$W \text{ (lb/ft)} = A_1 \gamma_1 + A_2 \gamma_2 = (0.26 \text{ ft}^2 * 125 \text{ pcf}) + (0.53 \text{ ft}^2 * 125 \text{ pcf}) = 99.4 \text{ lb/ft}$

$W * \sin(\alpha) = 99.4 \text{ lb/ft} * 0.09 = 8.9 \text{ lb/ft}$ (driving)

$W * \cos(\alpha) = 99.4 \text{ lb/ft} * 1.0 = 99.4 \text{ lb/ft}$

$N' = (W * \cos(\alpha)) - U = (99.4 \text{ lb/ft} * 1.0) - 0 \text{ lb/ft} = 99.4 \text{ lb/ft}$

Tan (φ) = tan(30 deg) = 0.58

$N' * \tan(\varphi) = 99.4 \text{ lb/ft} * 0.58 = 59.7 \text{ lb/ft}$ (resisting)

$c * B * \sec(\alpha) = 0 \text{ psf} * 1.75 * 1.02 = 0 \text{ lb/ft}$ (resisting)

Calculations: Example of driving and resistance forces for Slice 10

Slice 10 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 10A: } B \text{ (ft)} = 1.5 \text{ ft}$$

$$H \text{ (ft)} = 0.3 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = (1.5 \text{ ft} * 0.3 \text{ ft}) / 2 = 0.23 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = 10.6 \text{ degrees}$$

$$\text{Sin}(10.6 \text{ deg}) = 0.18$$

$$\text{Cos}(10.6 \text{ deg}) = 0.98$$

$$\text{Sec}(10.6 \text{ deg}) = 1.02$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (0.23 \text{ ft}^2 * 125 \text{ pcf}) = 28.1 \text{ lb/ft}$$

$$W * \sin(\alpha) = 28.1 \text{ lb/ft} * 0.18 = 8.9 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 28.1 \text{ lb/ft} * 0.98 = 27.56 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (28.1 \text{ lb/ft} * 0.98) - 0 \text{ lb/ft} = 27.56 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 27.56 \text{ lb/ft} * 0.58 = 16.5 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 1.5 * 1.02 = 0 \text{ lb/ft (resisting)}$$

Total sum of resisting forces:

Summation of resisting forces due to friction angle forces

$$= 62.4 + 222.2 + 352.6 + 403.7 + 406.1 + 402 + 253.4 + 167.3 + 59.7 + 16.5 = 2,345.8 \text{ lb/ft}$$

Summation of resisting forces due to cohesion forces

$$= 0 \text{ lb/ft}$$

$$\text{Summation of all resisting forces} = 2,345.8 \text{ lb/ft} + -14.01 \text{ lb/ft} = 2331.79 \text{ lb/ft}$$

Total sum of driving forces:

Total driving forces

$$= 103.5 + 283.9 + 348.4 + 292.5 + 213.8 + 136.7 + 46.9 + 2.8 = 1428.5 \text{ lb/ft}$$

Results:

$$\text{Factor of Safety} = \frac{\text{sum of resisting forces}}{\text{Sum of driving forces}} = \frac{2331.79}{1428.5} = 1.70$$

Driving Forces are equal to the summation of the weights of slices 1 through 10

Resistance Forces are equal to the summation of the shear forces (i.e. cohesion/friction) along the failure surface

See attached spreadsheet for complete list of slice calculations and attached Slope 7.0 model of global stability analyses. Based on hand calculation, the factor of safety against failure is 1.66, consistent with the Slope 7.0 software.

Conclusion:

The above factor of safety, which was computed by using the method of slices for a 1.5H:1V slope at Section C-C for excavations 5 feet or less, is consistent with the factors of safety computed via Slope 7.0 which utilized the Simplified Bishop and Janbu methods. The computer models calculated factor of safety values for this scenario of 1.5 (Bishop), which satisfy the minimum design factor of safety for slope stability of 1.5.

OSHA Excavation Slopes:

The contractor will be responsible to provide a safe excavation during the construction activities of the project. All excavations should be conducted in accordance with applicable federal, state, and local safety regulations, including, but not limited to the Occupational Safety and Health Administration (OSHA) excavation safety standards. In accordance with OSHA Regulation 29 CFR 1926 Subpart P Appendix B, the maximum allowable slopes for excavations less than 20 feet should be completed per the OSHA Excavation Slopes shown in Table 1. Excavations made in layered soil systems shall use the maximum allowable slope for each layer as prescribed in the OSHA Regulation. Excavations greater than 20 feet deep should be designed by a registered professional engineer; any shoring or bracing systems should be designed by a licensed structural engineer.

Table 1 – OSHA Excavation Slopes

Soil or Rock Type	Maximum Allowable Slope (H:V) for less than 20 feet
Stable Rock	Vertical (90°)
Type A ¹	¾:1 (53 °)
Type B ²	1:1 (45 °)
Type C ³	1 ½:1 (34 °)

¹ Type A Soils are cohesive soils with an unconfined compressive strength of 1.5 tons per square foot (tsf) or greater.

² Type B Soils are cohesive soils with an unconfined compressive strength greater than 0.5 tsf but less than 1.5 tsf, and includes angular gravel.

³ Type C Soils are cohesive soils with an unconfined compressive strength of 0.5 tsf or less, as well as cohesionless soils.

Excavation stability and soil pressures on temporary shoring are dependent on soil conditions, depth of excavations, installation procedures, and the magnitude of any surcharge loads on the ground surface adjacent to the excavation. Surcharge loads from the excavated materials, construction equipment, and vehicles should be included in the design of the excavation system. Excavation near existing structures and underground utilities should be performed with extreme care to avoid undermining existing structures.

Construction Excavation - Slope Stability Calculation - 5' Excavation
Long Term Circular Failure - slope 2H:1V

Slide Analysis Information

Carnotite Open Cut- 5 ft Excavation

Project Summary

Slide Modeler Version: 8.024

General Settings

Units of Measurement: Imperial Units
 Time Units: days
 Permeability Units: feet/second
 Data Output: Standard
 Failure Direction: Left to Right

Analysis Options

Slices Type: Vertical

Analysis Methods Used

Bishop simplified
 Janbu simplified

Number of slices: 10
 Tolerance: 0.005
 Maximum number of iterations: 50
 Check malpha < 0.2: Yes
 Initial trial value of FS: 1
 Steffensen Iteration: Yes

Groundwater Analysis

Groundwater Method: Water Surfaces
 Pore Fluid Unit Weight [lbs/ft3]: 62.4
 Use negative pore pressure cutoff: Yes
 Maximum negative pore pressure [psf]: 0
 Advanced Groundwater Method: None

Random Numbers

Pseudo-random Seed: 10116
 Random Number Generation Method: Park and Miller v.3

Surface Options

Surface Type: Circular
 Search Method: Grid Search
 Radius Increment: 10
 Composite Surfaces: Disabled
 Reverse Curvature: Invalid Surfaces
 Minimum Elevation: Not Defined
 Minimum Depth: Not Defined
 Minimum Area: Not Defined
 Minimum Weight: Not Defined

Seismic Loading

Advanced seismic analysis: No
 Staged pseudostatic analysis: No

Global Minimums

Method: bishop simplified

FS	1.713370
Center:	-1.107, 609.585
Radius:	17.053
Left Slip Surface Endpoint:	-13.620, 598.000
Right Slip Surface Endpoint:	2.860, 593.000
Resisting Moment:	41756.4 lb-ft
Driving Moment:	24370.9 lb-ft
Total Slice Area:	35.0349 ft2
Surface Horizontal Width:	16.4798 ft
Surface Average Height:	2.12594 ft

Method: janbu simplified

FS	1.567250
Center:	-3.217, 601.408
Radius:	9.293
Left Slip Surface Endpoint:	-11.863, 598.000
Right Slip Surface Endpoint:	0.742, 593.000
Resisting Horizontal Force:	2299.72 lb
Driving Horizontal Force:	1467.35 lb
Total Slice Area:	36.1929 ft2
Surface Horizontal Width:	12.6044 ft
Surface Average Height:	2.87144 ft

Valid/Invalid Surfaces

Method: bishop simplified

Number of Valid Surfaces: 26719
 Number of Invalid Surfaces: 1892

Error Codes:

Error Code -107 reported for 207 surfaces
 Error Code -108 reported for 1058 surfaces
 Error Code -109 reported for 1 surface
 Error Code -112 reported for 521 surfaces
 Error Code -118 reported for 105 surfaces

Method: janbu simplified

Number of Valid Surfaces: 26452
 Number of Invalid Surfaces: 2159

Error Codes:

Error Code -107 reported for 207 surfaces
 Error Code -108 reported for 1201 surfaces
 Error Code -109 reported for 1 surface
 Error Code -111 reported for 154 surfaces
 Error Code -112 reported for 491 surfaces
 Error Code -118 reported for 105 surfaces

Error Codes

The following errors were encountered during the computation:

- 107 = Total driving moment or total driving force is negative. This will occur if the wrong failure direction is specified, or if high external or anchor loads are applied against the failure direction.
- 108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
- 109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region, even though the slip surface is wholly within the soil region.
- 111 = safety factor equation did not converge
- 112 = The coefficient $M\text{-}\alpha = \cos(\alpha)(1 + \tan(\alpha)\tan(\phi)/F) < 0.2$ for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
- 118 = Surface does not pass through the search focus

Slope Stability Exhibits
7.5-Foot Excavations
Section D-D

Exhibits and Hand Calculations

Problem Statement:

Estimate the allowable factor of safety for global stability for utility excavation – Section D-D – from GSG Excavation Plan for OUC. Calculation is for the long-term drained condition and is based on the soil conditions present at the site, which generally consist of OSHA Type C soils that require a minimum excavation slope of 1.5H:1V, however, for the excavations in the area of Section D-D, less than 7.5 feet, can be considered with a 2H:1V slopes.

Approach and References:

1. Ordinary Method of Slices – see attached exhibit
2. Excavation Plan & Cross Sections

Definitions:

B = Width of slice

H = Average height of slice

A = Area of slice

α = Angle of failure surface

W = Weight of slice

σ_w = Average pore pressure of slice

U = Normal component of pore pressure

N' = Effective normal force

c = drained shear strength or cohesion

γ = total unit weight

ϕ = drained friction angle

Assumed Soil Parameters – Drained Condition:

Depth (ft)	Soil Description	c (psf)	γ (pcf)	ϕ (degrees)
0-6	Black Sand Fill	c1 = 0	$\gamma_1 = 125$	30
6-19	Loose to Med. Dense, Br/Gr Sand	c2 = 0	$\gamma_2 = 122$	34
19-33	Loose to Med. Dense, Gr Sand	c3 = 0	$\gamma_3 = 119$	32

Given:

Depth of long term water table = 19 feet (below max c

Maximum excavation depth – 7.5 feet

Slide slopes (max per OSHA soil type) – 2H:1V

- Effective Stress Analysis (ESA)

$$FS = \frac{\sum \{c'l + [(W/b) \cos \alpha - ul] \tan \phi'\}}{\sum [(W/b) \sin \alpha]}$$

Calculations: Example of driving and resistance forces for Slice 1

Slices 1 through 10 include the resisting forces contributed through the soil adjacent to the failure surface friction angle and cohesive forces for all slices

Slice 1 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 1A: } B \text{ (ft)} = 2.25 \text{ ft}$$

$$H \text{ (ft)} = 1.7 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = (1.7 \text{ ft} * 2.25 \text{ ft}) / 2 = 1.91 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -37.9 \text{ degrees}$$

$$\text{Sin}(-37.9 \text{ deg}) = -0.61$$

$$\text{Cos}(-37.9 \text{ deg}) = 0.79$$

$$\text{Sec}(-37.9 \text{ deg}) = 1.27$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (1.91 \text{ ft}^2 * 125 \text{ pcf}) = 239.1 \text{ lb/ft}$$

$$W * \sin(\alpha) = 239.1 \text{ lb/ft} * -0.61 = 145.8 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 239.1 \text{ lb/ft} * 0.79 = 188.9 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (239.1 \text{ lb/ft} * 0.79) - 0 \text{ lb/ft} = 188.9 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 188.9 \text{ lb/ft} * 0.58 = 107.6 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 2.25 * 1.27 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 2

Slice 2 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 2A: } B \text{ (ft)} = 2.0 \text{ ft}$$

$$H \text{ (ft)} = 3.1 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(3.1 \text{ ft} + 1.7 \text{ ft}) / 2] * 2 \text{ ft} = 4.8 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -33.1 \text{ degrees}$$

$$\text{Sin}(-33.1 \text{ deg}) = -0.55$$

$$\text{Cos}(-33.1 \text{ deg}) = 0.84$$

$$\text{Sec}(-33.1 \text{ deg}) = 1.19$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (4.8 \text{ ft}^2 * 125 \text{ pcf}) = 600 \text{ lb/ft}$$

$$W * \sin(\alpha) = 600 \text{ lb/ft} * -0.55 = 330 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 600 \text{ lb/ft} * 0.84 = 504 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (600 \text{ lb/ft} * 0.84) - 0 \text{ lb/ft} = 504 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 504 \text{ lb/ft} * 0.58 = 287.3 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 2 * 1.19 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 3

Slice 3 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 3A: } B \text{ (ft)} = 2.0 \text{ ft}$$

$$H \text{ (ft)} = 3.6 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(3.6 \text{ ft} + 3.1 \text{ ft}) / 2] * 2 \text{ ft} = 6.7 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -28.5 \text{ degrees}$$

$$\text{Sin}(-28.5 \text{ deg}) = -0.48$$

$$\text{Cos}(-28.5 \text{ deg}) = 0.88$$

$$\text{Sec}(-28.5 \text{ deg}) = 1.14$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (6.7 \text{ ft}^2 * 125 \text{ pcf}) = 837.5 \text{ lb/ft}$$

$$W * \sin(\alpha) = 837.5 \text{ lb/ft} * -0.48 = 402 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 837.5 \text{ lb/ft} * 0.88 = 737 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (837.5 \text{ lb/ft} * 0.88) - 0 \text{ lb/ft} = 737 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 737 \text{ lb/ft} * 0.58 = 420.1 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 2.0 * 1.14 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 4

Slice 4 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 4A: } B \text{ (ft)} = 2.5 \text{ ft}$$

$$H \text{ (ft)} = 3.5 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(3.5 \text{ ft} + 3.6 \text{ ft}) / 2] * 2.5 \text{ ft} = 8.88 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -24.1 \text{ degrees}$$

$$\text{Sin}(-24.1 \text{ deg}) = -0.41$$

$$\text{Cos}(-24.1 \text{ deg}) = 0.91$$

$$\text{Sec}(-24.1 \text{ deg}) = 1.10$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (8.88 \text{ ft}^2 * 125 \text{ pcf}) = 1109.4 \text{ lb/ft}$$

$$W * \sin(\alpha) = 1109.4 \text{ lb/ft} * -0.41 = 454.8 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 1109.4 \text{ lb/ft} * 0.91 = 1009.5 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (1109.4 \text{ lb/ft} * 0.91) - 0 \text{ lb/ft} = 1009.5 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 1009.5 \text{ lb/ft} * 0.58 = 605.7 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 2.5 * 1.10 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 5

Slice 5 exists in one (1) soil type that will be designated as follows: 1A) Black sand fill

$$\text{Slice 5A: } B \text{ (ft)} = 2 \text{ ft}$$

$$H \text{ (ft)} = 3.2 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = [(3.2 \text{ ft} + 3.5 \text{ ft}) / 2] * 2 \text{ ft} = 6.7 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -19.9 \text{ degrees}$$

$$\sin(-19.9 \text{ deg}) = -0.34$$

$$\cos(-19.9 \text{ deg}) = 0.94$$

$$\sec(-19.9 \text{ deg}) = 1.06$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (6.7 \text{ ft}^2 * 125 \text{ pcf}) = 837.5 \text{ lb/ft}$$

$$W * \sin(\alpha) = 837.5 \text{ lb/ft} * -0.34 = 284.8 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 837.5 \text{ lb/ft} * 0.94 = 787.3 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (837.5 \text{ lb/ft} * 0.94) - 0 \text{ lb/ft} = 787.3 \text{ lb/ft}$$

$$\tan(\varphi) = \tan(30 \text{ deg}) = 0.58$$

$$N' * \tan(\varphi) = 787.3 \text{ lb/ft} * 0.58 = 456.5 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 2 * 1.06 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 6

Slice 6 exists in one (1) soil type that will be designated as follows: 6A) Black sand fill and 6B) Brown and Gray Sand

Slice 6A: B (ft) = 2 ft

H (ft) = 2.2 ft

$$A_1 \text{ (ft}^2\text{)} = [(2.2 \text{ ft} + 3.2 \text{ ft}) / 2] * 2 \text{ ft} = 6.7 \text{ ft}^2$$

Slice 6B: B (ft) = 2 ft

H (ft) = 0.6 ft

$$A_1 \text{ (ft}^2\text{)} = (2 \text{ ft} * 0.6 \text{ ft}) / 2 = 0.6 \text{ ft}^2$$

Alpha (α) = -15.9 degrees

$$\sin(-15.9 \text{ deg}) = -0.27$$

$$\cos(-15.9 \text{ deg}) = 0.96$$

$$\sec(-15.9 \text{ deg}) = 1.04$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 + A_2 \gamma_2 = (6.7 \text{ ft}^2 * 125 \text{ pcf}) + (0.6 \text{ ft}^2 * 122 \text{ pcf}) = 748.2 \text{ lb/ft}$$

$$W * \sin(\alpha) = 748.2 \text{ lb/ft} * -0.27 = 202 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 748.2 \text{ lb/ft} * 0.96 = 718.3 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (748.2 \text{ lb/ft} * 0.96) - 0 \text{ lb/ft} = 748.2 \text{ lb/ft}$$

$$\tan(\varphi) = \tan(34 \text{ deg}) = 0.67$$

$$N' * \tan(\varphi) = 748.2 \text{ lb/ft} * 0.67 = 481.2 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 2 * 1.04 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 7

Slice 7 exists in one (1) soil type that will be designated as follows: 7A) Black sand fill and 7B) Brown and Gray Sand

Slice 7A: B (ft) = 2 ft

H (ft) = 1.2 ft

$$A_1 \text{ (ft}^2\text{)} = [(1.2 \text{ ft} + 2.2 \text{ ft}) / 2] * 2 \text{ ft} = 3.4 \text{ ft}^2$$

Slice 7B: B (ft) = 2 ft

H (ft) = 1 ft

$$A_1 \text{ (ft}^2\text{)} = [(1 \text{ ft} + 0.6 \text{ ft}) / 2] * 2 \text{ ft} = 1.6 \text{ ft}^2$$

Alpha (α) = -12.1 degrees

Sin(-12.1 deg) = -0.21

Cos(-12.1 deg) = 0.98

Sec(-12.1 deg) = 1.02

$$W \text{ (lb/ft)} = A_1 \gamma_1 + A_2 \gamma_2 = (3.4 \text{ ft}^2 * 125 \text{ pcf}) + (1.6 \text{ ft}^2 * 122 \text{ pcf}) = 620.2 \text{ lb/ft}$$

$$W * \sin(\alpha) = 620.2 \text{ lb/ft} * -0.21 = 130.2 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 620.2 \text{ lb/ft} * 0.98 = 607.8 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (620.2 \text{ lb/ft} * 0.98) - 0 \text{ lb/ft} = 607.8 \text{ lb/ft}$$

$$\tan(\varphi) = \tan(34 \text{ deg}) = 0.67$$

$$N' * \tan(\varphi) = 607.8 \text{ lb/ft} * 0.67 = 407.2 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 2 * 1.02 = 0 \text{ lb/ft (resisting)}$$

Calculations: Example of driving and resistance forces for Slice 8

Slice 8 exists in one (1) soil type that will be designated as follows: 8A) Black sand fill and 8B) Brown and Gray Sand

Slice 8A: B (ft) = 2 ft

H (ft) = 0.23 ft

$A_1 \text{ (ft}^2\text{)} = [(0.23 \text{ ft} + 1.2 \text{ ft}) / 2] * 2 \text{ ft} = 1.43 \text{ ft}^2$

Slice 8B: B (ft) = 2 ft

H (ft) = 1.3 ft

$A_1 \text{ (ft}^2\text{)} = [(1.3 \text{ ft} + 1 \text{ ft}) / 2] * 2 \text{ ft} = 2.3 \text{ ft}^2$

Alpha (α) = -8.4 degrees

Sin(-8.4 deg) = -0.15

Cos(-8.4 deg) = 0.99

Sec(-8.4 deg) = 1.01

$W \text{ (lb/ft)} = A_1 \gamma_1 + A_2 \gamma_2 = (1.43 \text{ ft}^2 * 125 \text{ pcf}) + (2.3 \text{ ft}^2 * 122 \text{ pcf}) = 459.4 \text{ lb/ft}$

$W * \sin(\alpha) = 459.4 \text{ lb/ft} * -0.15 = 68.9 \text{ lb/ft}$ (driving)

$W * \cos(\alpha) = 459.4 \text{ lb/ft} * 0.99 = 454.8 \text{ lb/ft}$

$N' = (W * \cos(\alpha)) - U = (459.4 \text{ lb/ft} * 0.99) - 0 \text{ lb/ft} = 459.4 \text{ lb/ft}$

Tan (ϕ) = tan(34 deg) = 0.67

$N' * \tan(\phi) = 459.4 \text{ lb/ft} * 0.67 = 306.5 \text{ lb/ft}$ (resisting)

$c * B * \sec(\alpha) = 0 \text{ psf} * 2 * 1.01 = 0 \text{ lb/ft}$ (resisting)

Calculations: Example of driving and resistance forces for Slice 9

Slice 9 exists in one (1) soil type that will be designated as follows: 9A) Black sand fill and 9B) Brown and Gray Sand

Slice 9A: B (ft) = 2 ft

H (ft) = 0.2 ft

$A_1 \text{ (ft}^2\text{)} = [(0.2 \text{ ft} + 0.23 \text{ ft}) / 2] * 2 \text{ ft} = 0.2 \text{ ft}^2$

Slice 9B: B (ft) = 2 ft

H (ft) = 1.5 ft

$A_1 \text{ (ft}^2\text{)} = [(1.5 \text{ ft} + 1.3 \text{ ft}) / 2] * 2 \text{ ft} = 2.8 \text{ ft}^2$

Alpha (α) = -4.8 degrees

Sin(-4.8 deg) = -0.08

Cos(-4.8 deg) = 1.0

Sec(-4.8 deg) = 1.0

$W \text{ (lb/ft)} = A_1 \gamma_1 + A_2 \gamma_2 = (0.2 \text{ ft}^2 * 125 \text{ pcf}) + (2.8 \text{ ft}^2 * 122 \text{ pcf}) = 366.6 \text{ lb/ft}$

$W * \sin(\alpha) = 366.6 \text{ lb/ft} * -0.08 = 29.3 \text{ lb/ft}$ (driving)

$W * \cos(\alpha) = 366.6 \text{ lb/ft} * 1.0 = 366.6 \text{ lb/ft}$

$N' = (W * \cos(\alpha)) - U = (366.6 \text{ lb/ft} * 1.0) - 0 \text{ lb/ft} = 366.6 \text{ lb/ft}$

$\tan(\varphi) = \tan(34 \text{ deg}) = 0.67$

$N' * \tan(\varphi) = 366.6 \text{ lb/ft} * 0.67 = 245.6 \text{ lb/ft}$ (resisting)

$c * B * \sec(\alpha) = 0 \text{ psf} * 2 * 1.0 = 0 \text{ lb/ft}$ (resisting)

Calculations: Example of driving and resistance forces for Slice 10

Slice 10 exists in one (1) soil type that will be designated as follows: 1A) Br/Gr Sand

$$\text{Slice 10A: } B \text{ (ft)} = 1.5 \text{ ft}$$

$$H \text{ (ft)} = 1.5 \text{ ft}$$

$$A_1 \text{ (ft}^2\text{)} = (1.5 \text{ ft} * 1.5 \text{ ft}) / 2 = 1.13 \text{ ft}^2$$

$$\text{Alpha } (\alpha) = -1.1 \text{ degrees}$$

$$\text{Sin}(-1.1 \text{ deg}) = -0.02$$

$$\text{Cos}(-1.1 \text{ deg}) = 1.0$$

$$\text{Sec}(-1.1 \text{ deg}) = 1.0$$

$$W \text{ (lb/ft)} = A_1 \gamma_1 = (1.13 \text{ ft}^2 * 122 \text{ pcf}) = 137.3 \text{ lb/ft}$$

$$W * \sin(\alpha) = 137.3 \text{ lb/ft} * 0.02 = 2.7 \text{ lb/ft (driving)}$$

$$W * \cos(\alpha) = 137.3 \text{ lb/ft} * 1.0 = 137.3 \text{ lb/ft}$$

$$N' = (W * \cos(\alpha)) - U = (137.3 \text{ lb/ft} * 1.0) - 0 \text{ lb/ft} = 137.3 \text{ lb/ft}$$

$$\text{Tan } (\varphi) = \tan(34 \text{ deg}) = 0.67$$

$$N' * \tan(\varphi) = 137.3 \text{ lb/ft} * 0.67 = 92 \text{ lb/ft (resisting)}$$

$$c * B * \sec(\alpha) = 0 \text{ psf} * 1.5 * 1.0 = 0 \text{ lb/ft (resisting)}$$

Total sum of resisting forces:

Summation of resisting forces due to friction angle forces

$$= 107.6 + 287.3 + 420.1 + 605.7 + 472.4 + 481.2 + 407.2 + 306.5 + 245.6 + 92 = 3425.6 \text{ lb/ft}$$

Summation of resisting forces due to cohesion forces

$$= 0 \text{ lb/ft}$$

$$\text{Summation of all resisting forces} = 3425.6 \text{ lb/ft} + 0 \text{ lb/ft} = 3425.6 \text{ lb/ft}$$

Total sum of driving forces:

Total driving forces

$$= 145.8 + 330 + 402 + 454.8 + 284.8 + 202 + 130.2 + 68.9 + 29.3 + 2.7 = 2050.7 \text{ lb/ft}$$

Results:

$$\text{Factor of Safety} = \frac{\text{sum of resisting forces}}{\text{Sum of driving forces}} = \frac{3425.6}{2050.7} = 1.70$$

Driving Forces are equal to the summation of the weights of slices 1 through 10

Resistance Forces are equal to the summation of the shear forces (i.e. cohesion/friction) along the failure surface

See attached spreadsheet for complete list of slice calculations and attached Slope 7.0 model of global stability analyses. Based on hand calculation, the factor of safety against failure is 1.7, consistent with the Slope 7.0 software.

Conclusion:

The above factor of safety, which was computed by using the method of slices for a 1.5H:1V slope at Section D-D for excavations 7.5 feet or less, is consistent with the factors of safety computed via Slope 7.0 which utilized the Simplified Bishop and Janbu methods. The computer models calculated factor of safety values for this scenario of 1.5 (Bishop), which satisfy the minimum design factor of safety for slope stability of 1.5.

OSHA Excavation Slopes:

The contractor will be responsible to provide a safe excavation during the construction activities of the project. All excavations should be conducted in accordance with applicable federal, state, and local safety regulations, including, but not limited to the Occupational Safety and Health Administration (OSHA) excavation safety standards. In accordance with OSHA Regulation 29 CFR 1926 Subpart P Appendix B, the maximum allowable slopes for excavations less than 20 feet should be completed per the OSHA Excavation Slopes shown in Table 1. Excavations made in layered soil systems shall use the maximum allowable slope for each layer as prescribed in the OSHA Regulation. Excavations greater than 20 feet deep should be designed by a registered professional engineer; any shoring or bracing systems should be designed by a licensed structural engineer.

Table 1 – OSHA Excavation Slopes

Soil or Rock Type	Maximum Allowable Slope (H:V) for less than 20 feet
Stable Rock	Vertical (90°)
Type A ¹	¾:1 (53 °)
Type B ²	1:1 (45 °)
Type C ³	1 ½:1 (34 °)

¹ Type A Soils are cohesive soils with an unconfined compressive strength of 1.5 tons per square foot (tsf) or greater.

² Type B Soils are cohesive soils with an unconfined compressive strength greater than 0.5 tsf but less than 1.5 tsf, and includes angular gravel.

³ Type C Soils are cohesive soils with an unconfined compressive strength of 0.5 tsf or less, as well as cohesionless soils.

Excavation stability and soil pressures on temporary shoring are dependent on soil conditions, depth of excavations, installation procedures, and the magnitude of any surcharge loads on the ground surface adjacent to the excavation. Surcharge loads from the excavated materials, construction equipment, and vehicles should be included in the design of the excavation system. Excavation near existing structures and underground utilities should be performed with extreme care to avoid undermining existing structures.

Long Term Circular Failure - slope 2H:1V

Resisting Forces	3425.64	(= 188.36+8956.6+4487.7)

Factor of Safety	-1.70	

Slide Analysis Information

Carnotite Open Cut- 7.5 ft Excavation

Project Summary

Slide Modeler Version: 8.024
 Compute Time: 00h:00m:00.504s

General Settings

Units of Measurement: Imperial Units
 Time Units: days
 Permeability Units: feet/second
 Data Output: Standard
 Failure Direction: Left to Right

Analysis Options

Slices Type: Vertical

Analysis Methods Used

Bishop simplified
 Janbu simplified

Number of slices: 10
 Tolerance: 0.005
 Maximum number of iterations: 50
 Check $m\alpha < 0.2$: Yes
 Initial trial value of FS: 1
 Steffensen Iteration: Yes

Groundwater Analysis

Groundwater Method: Water Surfaces
 Pore Fluid Unit Weight [lbs/ft³]: 62.4
 Use negative pore pressure cutoff: Yes
 Maximum negative pore pressure [psf]: 0
 Advanced Groundwater Method: None

Random Numbers

Pseudo-random Seed: 10116
 Random Number Generation Method: Park and Miller v.3

Surface Options

Surface Type: Circular
 Search Method: Grid Search
 Radius Increment: 10
 Composite Surfaces: Disabled
 Reverse Curvature: Invalid Surfaces
 Minimum Elevation: Not Defined
 Minimum Depth: Not Defined
 Minimum Area: Not Defined
 Minimum Weight: Not Defined

Seismic Loading

Advanced seismic analysis: No
 Staged pseudostatic analysis: No

Error Code -112 reported for 315 surfaces

Error Code -114 reported for 739 surfaces

Error Code -118 reported for 62 surfaces

Error Codes

The following errors were encountered during the computation:

-107 = Total driving moment or total driving force is negative. This will occur if the wrong failure direction is specified, or if high external or anchor loads are applied against the failure direction.

-108 = Total driving moment or total driving force < 0.1 . This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region, even though the slip surface is wholly within the soil region.

-111 = safety factor equation did not converge

-112 = The coefficient $M\text{-}\alpha = \cos(\alpha)(1 + \tan(\alpha)\tan(\phi))/F < 0.2$ for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-114 = Surface with Reverse Curvature.

-118 = Surface does not pass through the search focus

ENGINEERING PROPERTIES OF SOIL AND ROCK

IOWA DOT

Engineering Properties of Soil and Rock

Design Manual

Chapter 200

Geotechnical Design

Originally Issued: 01-15-14

Revised: 05-19-15

This section provides guidance on selecting soil and rock engineering properties for use in geotechnical design. Properties selected for design should be based on the results of field testing, laboratory testing, or back analysis of existing conditions. In addition, local experience, correlations to local geologic formations, and relevant published data should also be considered in the final selection of design parameters.

The geotechnical designer should assess the variability of the engineering properties to determine if the observed variability is a result of laboratory testing variability or subsurface variations across the site. The geotechnical designer is responsible for selecting the geotechnical engineering properties that are appropriate for the analyses required for design of the project.

Geotechnical design parameters should be established for each of the geologic strata identified at a project site. A geologic stratum, consisting of either soil or rock material, is characterized as having the same geologic depositional history and stress history, and generally has similarities throughout the stratum in terms of density, source material, etc.

Quick Tips:

- The geotechnical designer is responsible for determination of geotechnical parameters.
- Selection of soil/rock engineering properties requires that the designer understand the loading conditions and soil/rock behavior.

Soil Strata

Soil is a nonhomogeneous, porous material for which engineering behavior is greatly influenced by density, source material, stress history, and hydrogeology. Some engineering properties (e.g., undrained shear strength in normally consolidated clays) may vary as a predictable function of a stratum dimension (e.g., depth below the top of the stratum). Where the engineering property varies within a soil stratum, the engineer should develop the design parameters taking this variation into account. This may result in multiple values within the stratum.

Rock Strata

Determination of design parameters for rock should take into consideration the in-situ rock properties (condition of the rock mass), which are generally controlled by the discontinuities within the rock mass and not the properties of the intact material. A combination of laboratory testing on small samples, empirical analysis, field observations, and engineering judgment should be employed to determine the engineering properties of rock masses, with appropriate emphasis placed on visual observations and quantitative descriptions of the rock mass.

Influence of Existing and Future Conditions on Soil and Rock Properties

Soil properties are not intrinsic to the soil type, but vary with the influence of stress, groundwater, and other environmental conditions. Thus, it is important to determine the existing conditions, as well as how conditions may change over the life of the project. For example, construction of a new embankment places new surcharge loads on the underlying soil profile. As the stress increases due to loading, the engineering properties of the underlying soil strata may also change. For example, normally consolidated

clays can gain strength with increases in effective stress. On the other hand, over-consolidated clays or weak rock may lose strength with time when exposed in cuts. The geotechnical engineer is responsible for choosing design parameters representative of existing and future conditions.

Determination of Soil and Rock Properties

Subsurface soil or rock properties are generally determined using empirical correlations related to the testing that is performed during the field exploration program (e.g. Standard Penetration Test (SPT)) outlined in Section [200C-1](#) and/or the laboratory testing as outlined in Section [200D-1](#). The laboratory testing program generally consists of index tests (classification) to obtain general information or to use with correlations to estimate design properties, and performance tests (strength and compressibility) to directly measure specific engineering properties.

The observational method or back analysis can be used to determine engineering properties of soil or rock in cases where slope failures occur, or where embankment settlement or excessive settlement of existing structures have been observed. For instance, with landslides or slope failures, the geotechnical engineer determines the geometry of the failure and then selects the soil/rock parameters, aided by correlations with index tests (if available) or experience, that result in a factor of safety approaching 1.0. For embankment or structure settlement, the engineering properties of the soils can sometimes be determined from laboratory tests outside and inside the zone of stress influence resulting from the loading, and then correlating these properties for the magnitude of the known loads. As with slope stability analysis, the pre-existing and final geometry of the subsurface soil must be adequately known, including the history of the groundwater levels.

For the detailed measurement and interpretation of soil and rock properties, follow the guidelines provided in Section [200D-1](#) and FHWA-IF-02-034, [Evaluation of Soil and Rock Properties](#), Geotechnical Engineering Circular No. 5 (Sabatini, et al., 2002), except as specifically indicated herein.

Engineering Properties of Soil

The selection of soil properties for design and analysis by the geotechnical engineer requires that the designer has a good understanding of the loading conditions and the soil behavior, has high quality soil sampling and testing, and has local geotechnical experience with the various geologic formations. This section provides guidance in the selection of engineering properties for cohesive soils (clays and highly plastic silts) and cohesionless soils (sands and non-plastic silts) for use in geotechnical design.

Unit Weight

The total (wet) unit weight of soils, see Table 1, can be estimated from typical values, or measurements of mass and volume can be performed on Shelby tube samples or California or Modified California rings. Moisture content can provide the necessary data for calculating the dry unit weight of the materials.

Table 1: Typical unit weight values for soils in their natural state (after Peck, Hanson, and Thornburn, 1974).

soil description	dry unit weight (pcf)	wet unit weight (pcf)
uniform sand (loose)	90	118
uniform sand (dense)	109	130
well-graded sand (loose)	99	124
well-graded sand (dense)	116	135
windblown silt (loose)	85	116
glacial till	132	145
soft glacial clay	76	110
stiff glacial clay	106	129
soft slightly organic clay	58	98
soft very organic clay	43	89

Shear Strength

The shear strength of a soil can be evaluated by one of the following methods:

- Geotechnical laboratory testing.
- Correlations with in-situ field testing results.
- Correlations based on index parameters.

The laboratory test that is selected and used to evaluate the shear strength of a soil should be the method that is best suited to model the loading condition (undrained total stress or drained effective stress) and the soil response. Shear strength laboratory testing methods are described in Section [200D-1](#). The selection of peak, fully softened, or residual shear strength for design analyses should be based on review of the expected or tolerable displacements of the soil.

Undrained Cohesive: The short term, end of construction design of the project should be based on undrained (total) shear strength parameters. The undrained shear strength (S_u) of cohesive soils (clay and highly plastic silts) can be measured using unconfined compression (UC) tests, unconsolidated undrained (UU) triaxial tests, or consolidated undrained (CU) triaxial tests of undisturbed samples. Typically, the total internal friction angle (ϕ) is negligible and assumed to be zero ($\phi = 0$) in cohesive materials. However, if required for the analyses, the undrained (total) friction angle (ϕ) and cohesion components of the shear strength can be determined using appropriate laboratory testing methods.

The undrained shear strength (S_u) of cohesive soils may also be correlated to results of in-situ testing such as Standard Penetration Test (SPT), Cone Penetrometer Test (CPT), Flat Plate Penetrometer Test (CPT), Flat Plate Dilatometer Test (DMT), or Vane Shear Test (VST). For example, undrained shear strength (S_u) can be correlated to the N_{60} value obtained from the Standard Penetration Test (SPT). The undrained shear strength (S_u) can be estimated for low plasticity clays ($PI \leq 10$) and medium to high plasticity clays ($11 \leq PI \leq 40$) using the relationship developed by McGregor and Duncan, 1986, see Figure 1.

Figure 1: Undrained Shear Strength – SPT Relationship (McGregor and Duncan, 1986).

Drained Cohesive: The long-term design of the project's geotechnical components should be based on drained (effective) strength parameters. The use of peak or residual effective shear strength should be based on the expected or tolerable soil displacements. For normally-consolidated cohesive soils, the cohesive intercept (apparent cohesion) should be zero. For over-consolidated cohesive materials, such as many glacial tills, the cohesive intercept can be non-zero and may be established by consolidated undrained triaxial (CU) testing. The relationship between the peak/residual friction angle and the plasticity index as reported in NAVFAC DM7.1 generally works well for estimating the shear strength, see Figure 2.

Figure 2: Correlation between residual shear strength of over-consolidated clays and plasticity index (after NAVFAC, 1971).

Drained Cohesionless: The drained friction angle (ϕ') of granular deposits may be evaluated by correlation to the results of a Standard Penetration Test. The drained friction angle (ϕ') of granular deposits may also be determined based on the relationships provided in Table 2. Table 2 is based on data for relatively clean sands, thus, sands with a significant amount of clay/silt-sized material will fall in the lower portion of the range. The reported values of effective friction angle (ϕ'), based on SPT N60 values, should be reduced by 5° for clayey sands and should be increased by 5° for gravelly sands. Engineering judgment should be used in selecting a specific value.

Table 2: Relationship among relative density, SPT N value, and internal friction angle of cohesionless soils (after Meyerhof, 1956).

state of packing	relative density (%)	standard penetration resistance, N (blows/ft)	friction angle, ϕ' (°)
very loose	<20	<4	<30
loose	20-40	4-10	30-35
compact	40-60	10-30	35-40
dense	60-80	30-50	40-45
very dense	>80	>50	>45

Note: $N = 15 + (N' - 15)/2$ for $N' > 15$ in saturated very fine or silty sand, where N' = measured blow count and N = blow count corrected for dynamic pore pressure effects during the SPT.

Compressibility

Compressibility characteristics of the soils can be determined using laboratory testing or correlations to field/in-situ testing and index properties. Compressibility of soils is typically divided into two primary categories: 1) elastic settlement and 2) time-dependent settlement. Elastic settlements typically dominate in the cohesionless soils, while time-dependent settlements dominate in cohesive soils.

Cohesionless Soils: Obtaining high quality samples for laboratory testing can be extremely difficult in cohesionless soils. Therefore, indirect methods (correlations) of measuring the elastic parameters are used to develop compressibility parameters (elastic modulus, Poisson's ratio, etc.), see Sabatini et al. (2002). Where evaluation of elastic settlement is critical to the design of the foundation or selection of the foundation type, in-situ methods such as Cone Penetrometer (CPT), Pressuremeter (PMT), or Dilatometer (DMT) should be considered for evaluating the elastic modulus of the soil strata. Typical elastic modulus values of predominately granular materials are shown in Table 3.

Table 3: Typical elastic modulus values for granular soil (modified after Sabatini, 2002).

soil type	range of equivalent elastic modulus ksf / (kPa)
fine sand - loose - medium dense - dense	160 to 240 / (8,000 to 12,000) 240 to 400 / (12,000 to 20,000) 400 to 600 / (20,000 to 30,000)
sand - loose - medium dense - dense	200 to 600 / (10,000 to 30,000) 600 to 1,000 / (30,000 to 50,000) 1,000 to 1,600 / (50,000 to 80,000)
gravel - loose - medium dense - dense	600 to 1,600 / (30,000 to 80,000) 1,600 to 2,000 / (80,000 to 100,000) 2,000 to 4,000 / (100,000 to 200,000)

Note: 1ksf $\approx$ 50kpa.

Cohesive Soils: To determine the amount of consolidation settlement (primary and secondary) in cohesive soils, the following soil parameters are required: compression index (C_c), recompression index (C_r), secondary compression (C_α) index, consolidation coefficient (C_v), and the preconsolidation pressure (σ'_p). Compressibility parameters of cohesive soils can be determined from the results of one-dimensional consolidation tests. For preliminary analyses or where accurate prediction of settlement is not critical, values can be obtained from published correlations. If correlations for prediction of settlement are used, their applicability to the specific geologic strata under consideration should be evaluated. Refer to Sabatini et al. (2002) for discussion of the various available correlations of which some are outlined below.

Compression Index (C_c): Primary consolidation occurs as the pore pressures generated during loading dissipate. The amount of primary consolidation will be related to the compressibility characteristics of the soil, and can be determined from a one-dimensional consolidation test. In lieu of one-dimensional consolidation test data, the compression index can be estimated using a correlation established by Terzaghi and Peck (1967), which is valid for inorganic clays with sensitivity up to 4 and a LL less than 100.

$$C_c = 0.009 \times (LL - 10) \quad (\text{Equation 200E-1}_1)$$

where:

LL = Liquid Limit (%).

Recompression Index (C_r): The Recompression Index (C_r) can be determined from the one-dimensional consolidation test data or estimated using empirical correlations that relate it to the C_c values, in that the C_r value is approximately 10 to 20 percent of the C_c value (Ladd, 1973).

Secondary Compression Index (C_α): Secondary compression occurs after the completion of elastic and primary consolidation settlements, and should be included in the estimate of total settlement. The Secondary Compression Index (C_α) is best determined from consolidation testing; however, Figure 3 can be used for preliminary estimates of secondary compression settlement.

Figure 3: Secondary Compression Index Chart (NAVFAC DM-7.1).

Consolidation Coefficient (C_v): The rate of consolidation is directly related to the permeability of the soil and can be determined from a one-dimensional consolidation test. If laboratory test data is not available, an estimate of the Consolidation Coefficient (C_v) can be determined using Atterberg Limit test results and Figure 4.

Figure 4: Consolidation Coefficient and Liquid Limit Relationship (NAVFAC DM-7.1)

Preconsolidation Pressure (σ'_p): The effective preconsolidation stress (σ'_p) in soils is used to determine whether to use the Compression and/or Recompression Index. The effective preconsolidation stress (σ'_p) is the maximum past pressure that a soil has been exposed to since deposition. If one-dimensional consolidation test data is not available, the effective preconsolidation stress (σ'_p) can be estimated using a correlation to shear strength (S_u) and Plasticity Index (PI) (NAVFAC DM-7.1).

$$\sigma' = \frac{S_u}{(0.11 + 0.0037PI)} \quad \text{Equation 200E-1}_2$$

Engineering Properties of Rock

Engineering properties of rock are generally controlled by the discontinuities within the rock mass rather than the properties of the intact material. Therefore, engineering properties for rock must account for the properties of the intact pieces and for the properties of the rock mass as a whole, specifically considering the discontinuities within the rock mass. Rock properties can be divided into two categories: 1) intact rock properties and 2) in-situ rock mass properties.

Intact Rock Properties

Intact rock properties are measured from laboratory tests on samples obtained from coring or field mapping of exposures. Intact rock engineering properties obtained from laboratory tests can include specific gravity, unit weight, compressive strength, tensile strength, elastic modulus, Poisson's ratio and shear strength. Typical property values for different rock types can be found in Goodman (1989), Sabatini, et al. (2002), or AASHTO (2012).

Rock Mass (In-situ) Properties

Rock mass properties are determined by visual examination of rock cores and geologic mapping of discontinuities within the in-situ rock mass. For the majority of projects performed by the Soils Design Section, the rock mass properties are estimated using correlations to the rock type, recovery and rock quality designation (RQD). Recovery is defined as the length of core obtained expressed as a percentage of the total length cored. Rock Quality Designation (RQD) is defined as the total length of core pieces, 4 inches or greater in length, expressed as a percentage of the total length cored. Rock

Quality Designation (RQD) provides an indication of the integrity of the rock mass and relative extent of seams and bedding planes.

Other methods such as the rock mass rating (RMR) system or geologic strength index (GSI) may also be used to assess the design properties such as shear strength and elastic modulus for the rock mass. These alternate methodologies and correlations for determining rock mass properties are described in Sabatini, et al. (2002), Hoek, et al. (2002), and AASHTO (2012).

Properties of Predominant Geologic Units in Iowa

Loess

Loess is a windblown (eolian) soil consisting predominantly of silt-sized particles, and may contain minor amounts of sand and clay. Loess deposits range from almost 300 feet in the Loess Hills of western Iowa to less than 10 feet in south-central Iowa. Loess is typically not found in Iowa floodplain regions; however, loess-derived alluvium is present. Loess-derived alluvium has significantly different engineering properties compared to virgin loess. Loess generally has an increasing clay content as the distance increases easterly from the Missouri River (or other source). The clay component of loess (along with calcium carbonate in certain deposits) has been attributed to the cohesion that allows loess to stand vertical. However, upon wetting, the loess can collapse, resulting in excessive settlements. Claypan, a clay-rich loess, may be present underlying the topsoil in southeast Iowa (and sometimes in south-central Iowa) on the broad loess-capped upland flat areas. Claypan materials are unsuitable for use in roadway projects.

For engineering purposes, loess can generally be classified into three categories based on grain size: clayey loess, silty loess, and sandy loess. Table 4 presents typical engineering properties of Iowa loess.

Table 4: Typical engineering properties of Iowa loess.

material	soil type (USCS/AASHTO classification)	undrained		drained		dry unit weight (pcf)
		angle of internal friction (degrees)	cohesion (psf)	angle of internal friction (degrees)	cohesion (psf)	
claypan (loess derived) LL = 30 to 80 PI = 10 to 40	CL, CH A-4, A-5 , A-6 and A-7	8 to 12	50 to 600	15 to 25	0 to 200	75 to 95
clayey loess LL = 30 to 50 PI = 10 to 25	CL A-4, A-5 , A-6 and A-7	8 to 11	50 to 300	20 to 25	50 to 100	75 to 95
silty loess LL = 20 to 30 PI = 0 to 10	CL, CL-ML, ML A-4, A-5 , A-6 and A-7	11 to 14	50 to 150	22 to 28	0 to 50	70 to 90
sandy loess LL = nonplastic PI = nonplastic	ML A-3	13 to 16	0	26 to 32	0	70 to 90

Glacial Deposits

Glacial deposits consist of all material deposited or transported by a glacier or a glacier's meltwater stream and are found throughout Iowa. Glacial deposits that may be encountered within Iowa include: 1) the Des Moines Lobe, which consists of the most recent glacial deposits (Wisconsin age) and extends south to the site of modern-day Des Moines; 2) Illinoian glacial deposits that are found

only in southeast Iowa; and 3) Pre-Illinoian glacial deposits that are found throughout the state (generally buried beneath loess or alluvium or sporadically exposed in northeast Iowa). See Figure 5.

Figure 5: Limits of four glacial stages in Central North America (Prior 1976).

Glacial Till: Glacial till is predominately cohesive and consists of non-stratified deposits of clay, silt, sand, and gravel with cobbles and occasional boulders. In many instances in Iowa, typical glacial till is composed of roughly one third clay, one third silt, and one third sand with a few percentages of gravel. Sand and sand/gravel seams are common in many glacial till deposits. Boulders are common in these deposits and can range from a foot or two in diameter to the size of a bus. Glacial till has a relatively low permeability because of the fines content and the density. However, artesian conditions may be encountered within the water-bearing sand/gravel lenses in the glacial till.

Glacial Outwash: Glacial outwash is a partly-sorted mixture of clay, silt, sand, and gravel. Glacial outwash is predominately granular and consists of clayey/silty sands, fine sands, or clayey/silty gravels. Glacial outwash properties are similar to glacial till; however, glacial outwash tends to be predominately granular and consists of clayey/silty sands, fine sands or clayey/silty gravels. Glacial outwash is quite frequently stratified, mixed and non-uniform. Glacial outwash materials generally have a relatively high permeability, are water bearing, may have artesian conditions, and are susceptible to caving in open excavations or drilled holes.

Gumbotil: Gumbotil is a highly weathered soil that developed from glacial till during interglacial periods. Gumbotil is predominately found in the southern portion of the state. Gumbotil is frequently distinguished from the dark gray and brown glacial till by its light gray color and minimal sand content. Freshly excavated exposures are typically very hard, but will swell and soften rapidly upon exposure to moisture. Gumbotil is unsuitable for use in roadway projects.

Table 5 outlines the typical engineering properties of Glacial Till, Glacial Outwash, and Gumbotil. Engineering judgment and laboratory testing should be used in the evaluation and assignment of engineering properties.

Table 5: Typical engineering properties of glacial deposits.

material	soil type (USCS classification)	undrained		drained		dry unit weight (pcf)
		angle of internal friction (degrees)	cohesion (psf)	angle of internal friction (degrees)	cohesion (psf)	
Glacial Till	CL, CH, CL-ML A-4, A-5, A-6 and A-7	10 to 15	100 to 1500	20 to 30	50 to 500	110 to 120
Gumbotil	CL, CH A-4, A-5, A-6 and A-7	8 to 11	100 to 1000	16 to 22	50 to 500	90 to 115
Glacial Outwash	GW, GP, GW-GM, GP-GM, SW, SW-SM, SP, SC, SM A-1, A-3, A-3	25 to 34	0 to 50	28 to 38	0	90 to 110

Alluvium: Alluvium is all material deposited by streams. Alluvial soils are typically composed of clayey over-bank deposits underlain by silts, sandy silts, clayey silts, and silty sands. These soils generally have no continuity in their layering at shallow depths across a given site due to the complex process of erosion and deposition by flowing water and the varying depositional processes. However, continuity of soil layering does usually increase with depth in larger streams and rivers. Near surface soils normally consist of a combination of deposits deposited by slack water during flooding and tend to be finer-grained cohesive and moderately cohesive materials. Below the more cohesive blanket of surface and near surface alluvial soils, the deeper alluvial soils generally become less cohesive and grade from sandy silts and silty sands to medium to coarse sands, which become coarser grained and more dense with depth. Locally, clay filled abandoned channels and other features are often present and may contain isolated zones of clay and other cohesive soils.

The engineering properties of alluvial soils can vary significantly, so characterization of these materials through laboratory testing is preferred. Preliminary engineering properties for the cohesive and non-cohesive materials can be estimated using the correlations presented earlier in this section.

Bedrock

The bedrock in Iowa generally consists of sedimentary limestone, dolomite, shale, and sandstone. Thin layers of coal and gypsum are also found. With the exception of Sioux Quartzite exposed in far northwestern Iowa and the Manson Impact Structure in Calhoun and Pocahontas County, metamorphic and igneous rocks are found deeply buried beneath sedimentary rock and unconsolidated surficial deposits. The bedrock generally dips to the southwest at 2 degrees. The engineering properties of rock vary, so characterization of these materials through laboratory testing is preferred. Preliminary engineering properties for the bedrock can be estimated using the referenced publications presented earlier in this section.

Properties of Engineered Materials

Compacted soils are used to construct roadway embankments and bridge approaches. Selection of soil parameters for compacted soils should be based on laboratory testing or conservatively estimated from past test data and field correlations. Table 6 provides a guideline for engineering property selection on engineered fills based on the Soils Design Section's experience with soil materials typically found in Iowa.

The engineering properties are based primarily on classification, gradation, and compaction requirements, with consideration of the geologic source of the fill material. For suitable materials, where the material types vary, additional laboratory testing will be required to evaluate the range of engineering properties to be considered. For existing and new cohesive highway embankments, the Soils Design Section's standard of practice has been to assume a cohesion of 600 psf and a 12 degree friction angle for shear strength parameters; however, engineering judgment and project specific considerations must also be used in all instances.

Table 6: Typical engineering properties of engineered materials.

material	Iowa DOT standard specification	soil type (AASHTO/USCS classification)	friction angle (degrees)	cohesion (psf)	total unit weight (pcf)
suitable materials	2102.02.A	AASHTO T-99 Proctor Density of 95 pcf or greater, and AASHTO M 145 Group index less than 30 Liquid Limit (LL) < 50	Perform lab testing	Perform lab testing	Perform lab testing
select soils (cohesive)	2102.02.D.1.a	A-6 or A-7-6 soils of glacial origin (excluding Gumbotil and Palesols) Must have a AASHTO T-99 proctor density of 110 pcf or greater. Must have 45% or less silt content. Must have a plasticity index (PI) > 10	20 to 30	50 to 600	120 to 135
select soils (granular)	2102.02.D.1.b	A-1, A-2, or A-3 (0) / GW, GP, GW-GM, GP-GM, SW, SW-SM, SP Must have a AASHTO T-99 proctor density of 110 pcf or greater. Must have a combined silt and clay content of 15% or less (finer than 0.074 mm or #200 sieve). Must have a plasticity index (PI) of 3 or less	30 to 45	0	125 to 135

Final Property Selection

Engineering judgment and project specific considerations, combined with parametric analyses as needed, should always be used in selection of engineering properties. Previous experience with geologic units and other laboratory and field data should also be considered in the evaluation. The geotechnical engineer must recognize the variability of materials, and the influence of the uncertainty on the design level of safety. If the impact of this uncertainty is likely to be significant, parametric analyses should be conducted, or more data could be obtained to help reduce the uncertainty. The selection of engineering properties to be used for design is outlined in Sabatini, et al. (2002).

ABSTRACT: A number of triaxial compression tests have been performed by The Danish Geotechnical Institute over the past decades on undisturbed overconsolidated Danish clays; ranging from clay till of low plasticity to extremely high plasticity marine Tertiary clays. The test results confirm that the drained peak angle of shearing resistance can be related to the plasticity index, though a large scatter is generally seen. Based on the results and a review of published data a conservative relationship between drained peak angle of shearing resistance and plasticity index for undisturbed overconsolidated clays is proposed. The proposed relationship and the interrelation to the effective cohesion are discussed.

RÉSUMÉ: De nombreux essais de compression triaxiale ont été effectués par l'Institut danois de géotechnique au cours des dernières décennies sur les argiles danoises surconsolidées non perturbées, allant des argiles morainiques ayant une plasticité faible à des argiles marines tertiaires ayant une plasticité extrêmement élevée. Les résultats des essais confirment que l'angle de résistance maximale au cisaillement des sols drainés peut être lié à l'indice de plasticité si une forte dispersion est généralement observée. Sur la base de ces résultats et à partir d'un ensemble de données déjà publiées, une relation conservatrice entre l'angle de résistance maximale au cisaillement des sols drainés et l'indice de plasticité pour les argiles surconsolidées non perturbées est proposée. La relation proposée et les liens à une cohésion effective sont discutés.

KEYWORDS: Plasticity index, Drained shear strength, Laboratory testing, Overconsolidated clay

1 INTRODUCTION

Empirical correlations are widely used in geotechnical engineering practice as a tool to estimate the engineering properties of soils. Useful correlations exist between the index properties obtained from simple routine testing and the strength and deformations properties of cohesive soils among others. For practical purposes the results of routine index tests and correlations can be used as a first approximation of the soil parameters for use in preliminary design of geotechnical structures, and later as a mean to validate the results of laboratory tests. Results from several index tests obtained for a given site can be used to assess the variation in the properties of the soil mass.

This study is aiming to provide a conservative correlation between the effective peak angle of shearing resistance and plasticity index I_p for natural undisturbed overconsolidated Danish clays based on the results from a large database of triaxial compression tests performed by The Danish Geotechnical Institute (GEO) over the past decades.

1.1 Stress-strain behavior and effective strength of overconsolidated clays

In contrast to normally consolidated (NC) clays highly overconsolidated (OC) natural clays typically show a distinct strain softening behavior in drained triaxial compression, which can be related to the breakdown of interparticle bonding and the dilatant behavior of the compact clay structure (Burland 1990). With further shearing in the post peak region OC clays (as well as NC clays) may experience an additional reduction in strength due to the alignment of the platy clay particles on the failure plane (residual state). The stress-strain behavior of OC clays compared to NC clays is illustrated in Figure 1a.

Figure 1. Peak and residual shear strength for normally consolidated and overconsolidated soils (a) Typical stress-strain curves (b) Failure envelopes showing the associated angle of shearing resistance, ϕ'

Stiff fissured overconsolidated clays may fail along preexisting fissures in which case the strength is governed by the fissure strength. Skempton (1957) found the fissure strength to correspond to the fully softened strength i.e. shear strength of the reconstituted normally consolidated soil, which is less than

the peak strength of the OC clay, but greater than the residual strength.

It is generally accepted that the effective strength of uncemented saturated clays is frictional and the strength envelope is nonlinear. Hence the strength envelope will pass through origin, and so the true cohesive intercept $c'=0$ kPa (Burland 1990). However, over the typical range of stress levels met in practice (~50-400kPa) the effective peak strength for NC and OC clays can be approximated by a linear relationship between effective normal stress at failure σ'_f and shear strength τ_f using the Mohr-Coulomb strength equation:

$$\tau_f = \sigma'_f \tan(\phi') + c' \quad (1)$$

where ϕ' and c' respectively are the tangent drained angle of shearing resistance and the apparent cohesive intercept, as illustrated in Figure 1b. For OC clays $c'_{oc} > 0$ kPa and for NC clays $c'_{nc} \approx 0$ kPa. While the angles of shearing resistance for OC and NC clays are typically found not to differ much.

Generally the frictional resistance to shearing, as expressed by ϕ' , can be expected to decrease as the content of platy clay minerals increase in the soil mass. With increasing content of platy clay particles both the liquid limit w_L and the plasticity index I_p will increase, and hence a correlation between ϕ' and w_L or I_p can be expected.

1.2 Existing relationships between effective shear strength and plasticity index

Several studies have been reported in the literature with regards to the correlation between the effective angle of shearing resistance ϕ'_{peak} and plasticity index I_p (Brooker and Ireland 1965, Ladd et al. 1977, Stark and Eid 1997, Terzaghi et al. 1996 among others). These studies are however mainly focused on normally consolidated reconstituted or undisturbed natural clays, while only little has been reported for overconsolidated undisturbed clays.

Figure 2 shows collected data from the literature in a plot of ϕ'_{nc} vs. I_p (single log plot) for primarily NC clays (I_p range 5-240%). ϕ'_{nc} generally represent a peak secant value with the assumption that c'_{nc} is zero. A very significant scattering of the data points is seen, e.g. at $I_p=20\%$ the value of ϕ'_{nc} is found to vary between approximately 25deg. and 35deg. However, despite the significant scatter a trend of reducing ϕ'_{nc} with increasing I_p is seen, and the data furthermore suggest the existence of a lower bound value for ϕ'_{nc} at given value of I_p .

Figure 2. ϕ'_{nc} vs. I_p for primarily normally consolidated reconstituted and undisturbed clays after Ladd et al. 1977 (with data from Kenney 1959 and Bjerrum and Simons 1960), Terzaghi et al. 1996 and Brooker and Ireland 1965.

The shaded area in Figure 2 represents the range of results reported by Stark and Eid 1997 from a large series of ring shear tests on 24 different reconstituted normally consolidated natural soils ($I_p=8-244\%$, Clay-size fraction $CF=10-88\%$, normal effective stress $\sigma'_n=50-400$). Based on the data, relationships

between ϕ'_{nc} and I_p were proposed which were dependent on clay-size fraction and normal effective stress, as seen in Figure 3. By taking account of clay-size fraction and stress level Stark and Eid showed a significantly reduced scatter around the mean trend lines. A downward shift in the trend lines were observed with increasing stress levels and increasing clay-size fraction. The findings by Stark and Eid suggests that the observed scatter in the reported data found in the literature, as shown in Figure 2, to a large extent can be explained by variations in stress level due to a non-linear strength envelope and additionally clay-size fraction, as both soil mineralogy and clay-size fraction are not accounted for solely by the variation in the index properties.

Figure 3. ϕ'_{nc} vs. I_p for reconstituted normally consolidated soils as a function of clay-size fraction and normal effective stress (Stark and Eid 1997)

Based on the literature data a cautious lower bound (LB) estimate of the relationship between ϕ'_{nc} and I_p for NC clays can be derived together with a best estimate from the best-fit regression line through the data, as indicated in Figure 2 and given below.

$$\text{Cautious LB estimate: } \phi'_{nc} = 39 - 11 \cdot \log I_p \text{ (deg.)} \quad (2)$$

$$\text{Best estimate: } \phi'_{nc} = 43 - 10 \cdot \log I_p \text{ (deg.)} \quad (3)$$

The lower bound estimate, which correspond roughly to the 5% fractile, also approximately match the lower bound of the range of results reported by Stark and Eid for clay-size fractions above 50% and a stress level of 400kPa. Hence for clay-size fractions below 50% and stress levels below 400kPa the effective angle of shearing resistance ϕ'_{nc} can be expected to be significantly greater than estimated from eq. 2 (up to approximately 12deg. for $CF < 20\%$ and $\sigma'_n = 50$ kPa, as seen from Figure 3).

2 SOIL DESCRIPTION AND TEST PROCEDURES

A number of triaxial compression tests have been performed by GEO on various undisturbed overconsolidated clays over the past decades. Test data have been collected from older tests (> 30 years) and more recent test series as listed in Table 1.

2.1 Soil description

The tested soils range from very low plasticity clay tills to extremely high plasticity Eocene clays. The recent tests include a test series in connection to the 1992 Great Belt bridge (GB) ground investigation, which provides a significant amount of test data for very low plasticity clay till. While the newly completed 2011 Fehmarnbelt (Fixed Link) (FB) ground investigation contribute significantly to the understanding of the strength behavior of very high to extremely high plasticity Eocene and Paleocene marine clays from the Røsnes, Ølst and Holmehus clay formations. The majority of the investigated clays from the Fehmarnbelt (Fixed Link) ground investigation have been assessed to be situated within glacial folded strata. A

series of recent tests in connection to a ground investigation at Esbjerg Harbour (EB) highlights the strength properties of Mica clay – a Miocene marine clay of high plasticity.

The additional old test data covers glacial clay till, a few glacial/late glacial meltwater and late glacial marine clays and furthermore a wide range of Tertiary (Palaeogene) marine clays of late Miocene age to Palaeocene age: Mica clay, Septarian clay, Søvind marl, Lillebælt clay, Røsnes clay, Ølst clay, Tarras clay and Holmehus clay.

The majority of the very high plasticity Palaeogene clays from the listed test series are found to be fissured in nature.

Figure 4 shows the outline of the index properties of the tested clays in Casagrandes classification chart. The classification parameters have generally been determined in accordance with BS 1377:Part 2:1990 using the Casagrande method to determine the liquid limit. The data points for the different soils generally fall close around straight lines and above the A-line corresponding to clays of very low ($4\% < I_p < 7\%$) to extremely high plasticity ($I_p > 100\%$).

Figure 4. Outline of index properties of the tested clays shown in Casagrandes classification chart I_p vs. w_L .

The classification parameters incl. clay-size fraction (CF) and natural water content w_n for the tested clays are also listed in Table 1 alongside test types and number of tests (n). For the consistent test series (GB, FB and EB) the mean values of the classification parameters are listed and the standard deviations are shown in brackets. A more detailed description of the Palaeogene clays incl. mineralogy is given by Fehmarnbelt (Fixed Link) 2011.

2.2 Test procedures

The recent triaxial compression tests have generally been performed on nominally undisturbed specimens with a diameter of approximately 70mm and a height to diameter ratio of 1. Smooth end platens have been used. Samples have been extracted by means of a push-in Shelby-tube sampler (called A-tube in Denmark) with an inner diameter of 70mm.

Samples are saturated using backpressure and typically preloaded to reduce the effects of possible sample disturbance and bedding effects. The preloading are in most cases performed under anisotropic K_0 conditions. After the preloading and unloading of the sample, the specimen is sheared in either drained or undrained compression to failure. Multiple tests are carried out, consisting of preloading, unloading to a new and higher stress level followed by a drained or undrained compression test (these steps are repeated 2 or more times).

The applied rate of straining during shearing is chosen according to the soil type to ensure slow enough rates to achieve full equalization of pore water pressures in the specimen. For the high plasticity clays this means that the applied strain rate is around 0.02-0.05%/hr, while a strain rate of approximately 0.1-0.7%/hr has been used for specimens of clay till.

For specimens of very high plasticity clay care is generally taken during all test stages to avoid that the effective stress reduces below the in-situ stresses to prevent swelling, which

may lead to destructuration of the micro-structure (Leroueil and Vaughan 1990).

Older triaxial compression tests have in contrast typically been performed with a height to diameter ratio of 2:1 and a diameter of approximately 36 mm. Samples were usually extracted using a 42mm inner diameter sampler. Preloading was in some cases carried out under isotropic conditions and in some cases omitted. Saturation was in most cases carried out without the application of backpressure and compression was performed with the pore water pressure kept equal to zero. Hence, undrained compression was achieved by adjusting the cell pressure during testing to obtain constant volume displacement.

The applied rate of straining during the compression stage was generally higher than what would be recommended today to ensure full equalization of pore water pressures within the samples of especially high plasticity clays. Hence, the actual effective stresses at the failure state are somewhat uncertain because the pore water pressure is unknown. Nevertheless, the old triaxial tests constitute a very comprehensive database of strength parameters for low to high plasticity clays, which can be compared to the recent and presumably more reliable tests results.

Table 1. Overview of classification parameters and larger series of triaxial compression tests on undisturbed overconsolidated clays performed by GEO.

Project	Soil type	$w_n^{\#}$ [%]	$w_L^{\#}$ [%]	$I_p^{\#}$ [%]	$CF^{\#}$ [%]	Test types	n

[#] mean values with the standard deviation shown in brackets

An overview of the number of tests (n) and test types are given in Table 1. The following abbreviations are used:

- CAU/CAD Anisotropically (K_0) Consolidated. Undrained/Drained compression.
- MCAU/MCAD Anisotropically (K_0) Consolidated. Undrained/Drained compression. Multiple test on the sample.
- CU/CD Isotropically Consolidated Undrained /Drained compression.
- u=0 denominates older test procedures with no backpressure and pore water pressure kept at zero kPa.

The drained strength parameters; angle of shearing resistance ϕ' and effective cohesion c' can be derived from the results of two or more compression tests (either using multiple testing on the same sample or sets of two or more compression tests on samples with similar properties). Alternatively, the strength parameters can be interpreted from the undrained compression effective stress path, since the effective stress path for overconsolidated clays will tend to climb the strength envelope as the soil dilates and the pore water pressures decrease.

Generally, test interpretation may be difficult in cases where the specimen experiences destructuration during testing or if the sample is fissured.

3 DRAINED SHEAR STRENGTH AND PLASTICITY INDEX

3.1 Drained peak angle of shearing resistance

Figure 5 shows the relationship between the drained peak angle of shearing resistance ϕ'_{oc} and the plasticity index I_p (single log plot) as derived from triaxial compression tests performed by GEO on the various overconsolidated undisturbed clays shown in Table 1.

ϕ'_{oc} has generally been derived as a tangent value, to minimize the otherwise high influence of stress level resulting from the initially curved failure envelope. Hence, both values of ϕ'_{oc} and c'_{oc} are obtained from the tests. Results from the older tests (> 30 years, open points) are shown separately from the more recent tests (closed points).

The shaded area and dashed lines respectively represents results of the series of triaxial compression tests on palaeogene clays and glacial till deposits (Lower and Upper till) performed in connection to the Fehmarnbelt (Fixed Link) 2011 ground investigation. The spans shown in the I_p and ϕ'_{oc} values represent mean values ± 1 standard deviation.

Figure 5. Relationship between peak angle of shearing resistance ϕ'_{oc} and plasticity index I_p for overconsolidated undisturbed clays

A large scatter in the data and a trend of reducing ϕ'_{oc} with increasing I_p is generally seen similarly to what was observed for NC clays in figure 2.

It is observed that the old triaxial test results generally show a much larger spread than the results of the presumably more reliable recent triaxial tests. Furthermore, the new test data tend to be found in the lower half of the range of results from the old tests. This indicates that ϕ'_{oc} is likely to be overestimated by the old tests. The use of high strain rates and the lack of full saturation in the old undrained $CU_{u=0}$ triaxial compression tests are likely to have lead to some uncertainties in the actual effective stress state at failure. This may explain some of the observed differences between the results from the old and more recent triaxial compression tests.

As for NC clays some of the scatter may arise as a result of variations in clay-size fraction, since this is not accounted for solely by the variations in I_p . Variations in stress level on the

other hand should have less of an influence, since a tangent value of ϕ'_{oc} is derived from a failure envelope which is approximately linear within the typical stress range (100-600kPa), as seen in Figures 8-10. As mentioned previously, difficulties in test interpretation and influence of fissures and destructuration may have influenced some of the results.

Based on previous experience and much of the old data shown in Figure 5 within the I_p range of 6%-106%, GEO (Knudsen 1981) has since the early 80's suggested using the following correlation to get a cautious lower bound estimate of ϕ'_{oc} on the basis of a mean value of I_p :

$$\phi'_{oc} = 45 - 15 \cdot \log I_p \quad (\text{deg.}) \quad (4)$$

In the light of the more recent test data, which extends the I_p range, especially in the high I_p end, to 4%-151%, it is suggested that the lower bound values of ϕ'_{oc} should be slightly less than previously predicted by eq. 3 for very low I_p clays and somewhat higher for high plasticity clays ($I_p > 50\%$). Hence, it is suggested to use the following revised cautious lower bound (LB) estimate of the relationship between ϕ'_{oc} and the plasticity index I_p as given by eq. 5 and 6, and shown in Figure 5 (solid line):

Cautious LB estimate:

$$4 < I_p < 50 \quad \phi'_{oc} = 44 - 14 \cdot \log I_p \quad (\text{deg.}) \quad (5)$$

$$50 \leq I_p < 150 \quad \phi'_{oc} = 30 - 6 \cdot \log I_p \quad (\text{deg.}) \quad (6)$$

For an I_p value of 100%, which is typical for e.g. Røsnes clay, this means that the lower bound estimate increases from a peak value of 15 deg. using eq. 4 to 18 deg. using eq. 6.

The estimate given by the best-fit regression line through the recent test data is shown in Figure 5 (chain dotted line) and is given by:

Best estimate:

$$4 < I_p < 50 \quad \phi'_{oc} = 45 - 14 \cdot \log I_p \quad (\text{deg.}) \quad (7)$$

$$50 \leq I_p < 150 \quad \phi'_{oc} = 26 - 3 \cdot \log I_p \quad (\text{deg.}) \quad (8)$$

Eq. 5-8. are believed to be applicable to most overconsolidated natural clays with clay-size fractions below 80%. For soils with clay-size fractions higher than 80% the above relationships should be used with caution until its validity is confirmed by additional tests.

It should be noted that some cases may dictate a mobilized angle of shearing resistance which is lower than the above estimated peak values, e.g. when progressive failure is considered in connection to slope stability analysis in high plasticity clays (Skempton 1977, Burland 1990).

The lower bound estimate for NC clays is shown in Figure 5 (dash-double-dot line) for comparison. It is observed that the lower bound estimates for NC and OC clays do not deviate much.

3.2 Effective cohesion

Figure 6 shows the relationship between the cohesive intercept of the strength envelope c'_{oc} and the plasticity index I_p (single log plot). Data from recent tests and older tests (>30 years) are separated. Two sets of c'_{oc} values have been plotted: the derived values from the tests and estimated values of c'_{oc} . The derived values have been interpreted from the tests results and are paired with the ϕ'_{oc} values shown in Figure 5. While the estimated value of c'_{oc} is found from each failure point (σ'_f , τ_f) by subtracting the stress dependent "frictional" strength contribution $\sigma'_f \tan(\phi'_{oc})$ from the shear strength τ_f . This can also be expressed in terms of mean effective stress $s'_f = 1/2(\sigma'_1 + \sigma'_3)$ and shear stress $t_f = 1/2(\sigma'_1 - \sigma'_3)$ from the following equation.

$$c'_{oc,est} = \frac{t_f - s'_f \cdot \sin \phi'_{oc,est}}{\cos \phi'_{oc,est}} \quad (9)$$

where $\phi'_{oc,est}$ is the the lower bound estimate of the angle of shearing resistance, as given by eq. 5. and 6. on the basis of I_p . The estimated c'_{oc} may show negative values in cases where the estimation of ϕ'_{oc} is too high.

The intercept of the strength envelope is very sensitive to the interpretation of the test results, and factors like destructuration or influence of fissures may have great impact on the failure points and hence the value of c'_{oc} . The scatter in the data points will therefore be very significant, much more so than what was observed for ϕ'_{oc} in figures 2 and 5. Despite the scatter a weak trend of reducing lower bound value of c'_{oc} with increasing I_p is seen for I_p greater than 7%. Part of the data from the old tests has been excluded since it is not certain if the meltwater and late glacial marine deposits are heavily overconsolidated (overconsolidation ratio OCR>4).

Figure 6. Relationship between effective cohesion c'_{oc} and plasticity index I_p for overconsolidated undisturbed clays

The test results from the Great Belt bridge ground investigation (GB) on very low I_p ($4\% < I_p < 7\%$) clay till are seen to deviate significantly from the general trend by showing relatively low c'_{oc} values; typically between 0 and 15 kPa. This is true for both the derived and estimated values of c'_{oc} . One or several factors might explain this, among others: a) Some of the tested clays are possibly ablation tills that are deposited in a nearly normally consolidated state. b) The clay till may have been subject to postdepositional geological processes (e.g. subsequent passing of ice sheets, meltwater, heave etc.), which may have disturbed the structure and erased the effects of overconsolidation. c) Generally, the tested clay tills have a high content of silt, sand and gravel, and the soils can therefore be characterized as transitional soils, which in terms of strength may behave more like a frictional soil ($c'_{oc} \approx 0$ kPa) than clay. This is further supported by the fact that the I_p value is likely to be overestimated, as particles larger than 0.425 mm have been removed prior to classification in accordance with BS1377:part 2:1990. An estimated 20-40% of the soil particles have been removed. Hence sand till or gravel till may in most cases be a more representative classification for the tested till deposits.

The low c'_{oc} values observed at very high I_p values above 60% are likely to be a result of fissures and/or sample destructuration. Destructuration may result from large straining events during sampling, sample preparation, testing or geological history. The Palaeogene clays from the Fehmarnbelt (Fixed Link) project mostly belong to an upper stratum which is folded by glacier. Hence, the measured strengths are likely to be influenced by varying degrees of destructuration caused by glacial disturbance of the otherwise intact clay layers.

The significant variation in the c'_{oc} values seen in Figures 6 and 7 also seem to indicate this. For heavily overconsolidated clays with $7\% < I_p < 80\%$ the test data indicate a cautious lower bound estimate of the relationship between c'_{oc} and the plasticity index, I_p as shown on Figure 6 (solid line) and given by the following equations depending on the value of I_p :

Cautious lower bound estimate:

$$7\% < I_p < 30\% \quad c'_{oc} = 30 \quad (\text{kPa}) \quad (10)$$

$$30\% \leq I_p < 80\% \quad c'_{oc} = 48 - 0.6 \cdot I_p \quad (\text{kPa}) \quad (11)$$

$$I_p > 80\% \quad c'_{oc} = 0 \quad (\text{kPa}) \quad (12)$$

While the drained angle of shearing resistance ϕ'_{oc} is more naturally linked to soil mineralogy composition, as expressed partly by the I_p value, the apparent effective cohesion is more naturally linked to the soil structure and dilative tendencies. As the I_p value is determined from reconstituted state it does not take account of soil structure. Hence, the above relationship between c'_{oc} and I_p may not be the most appropriate to use.

As suggested in the previous Danish code of practice for foundations (Danish Standard DS 415) it may be expected that the value of c'_{oc} is better related to the undrained shear strength c_u rather than I_p . Both c_u and c'_{oc} are influenced by soil structure and dilation, but as the stress level is likely to have a greater impact on c_u than c'_{oc} , the relationship will not be unique. Based on a comparison of the drained and undrained bearing capacity in connection to plate loading tests on clay till (Jacobsen 1970), the previous Danish code of practice for foundations suggests the following cautious estimate of c'_{oc} on the basis of c_u :

$$c'_{oc} = 0.1 \cdot c_u \quad (\text{kPa}) \quad (13)$$

Figure 7 shows the relationship between c'_{oc} and c_u based on data from the performed tests. As before both derived values from the tests and estimated values of c'_{oc} are shown. As expected the observed scatter is very significant, but there is a tendency of increasing values of c'_{oc} with increasing values of c_u . Both recent and older data appear to verify that the relationship between c'_{oc} and c_u given by eq. 13 can be used as a cautious lower bound estimate with an upper limit of $c'_{oc} = 30$ kPa for all heavily overconsolidated clays except very low I_p clay till. For very low I_p clay till the effective cohesion c'_{oc} is in the majority of cases found to be lower than given by eq. 13, as shown by the shaded area in Figure 7. Hence, in agreement with observations from Figure 6 it is suggested to use $c'_{oc} = 0$ kPa for very low I_p ($4\% < I_p < 7\%$) clay till/transitional soils independently of c_u , unless specific triaxial test data is available to suggest otherwise. $c'_{oc} = 0$ kPa should also be assumed for fissured high plasticity clays in cases where the overall mobilized strength may be governed by the fissure strength.

Figure 7. Relationship between effective cohesion c'_{oc} and undrained shear strength c_u for overconsolidated undisturbed clays

Generally it is suggested to estimate c'_{oc} on the basis of eq. 13 for clays with I_p values between 7% and 150%. It should however be noted that if both ϕ'_{oc} and c'_{oc} are estimated cautiously using the above correlations then the estimated combined strength may in some cases be too conservative. On the other hand, the combined strength found from the proposed correlations may overestimate the strength at low effective

stresses (<50 kPa) as the failure envelope curves towards origin (see Figure 1b).

4 VALIDATION OF THE PROPOSED RELATIONSHIPS

The test results from the three test series from the Great Belt (GB), Fehmarnbelt (Fixed Link) (FB) and Esbjerg Harbour (EB) ground investigations are shown in Figures 8-10. The figures show the failure points for each shear stage for all the tested specimens in a plot of shear stress t against mean effective stress s' . For each test series the best-fit line through the data points is shown, and for comparison the cautiously estimated effective strength envelope is also shown (dashed line). The estimated strength envelope is based on the estimated angle of shearing resistance ϕ'_{oc} found from eq. 5-6 on the basis of the mean value of I_p for the tested clays, and the effective cohesion c'_{oc} determined from eq. 13. c_u has been assumed equal to the mean shear stress t_{fm} at failure, as derived from the best-fit regression line through the failure points.

It is observed that the estimated strength envelope in all cases provides a cautious estimate of the strength of the tested clays within the given stress intervals.

5 CONCLUSION

Simple correlations between the plasticity index and the drained peak strength parameters in terms of ϕ'_{oc} and c'_{oc} have been proposed on the basis of a comprehensive database of triaxial compression tests on undisturbed overconsolidated Danish clays of very low to extremely high plasticity. The proposed correlations gives cautious lower bound values of the drained strength parameters, which can be used as a first approximation for use in preliminary design of geotechnical structures. Furthermore, the correlations can be used to evaluate the results of laboratory effective strength tests, and as a mean to assess how well these results represent the entire soil mass at a given site when viewed in connection to the variations of the index properties in the soil mass.

The authors however believe that the proposed correlations should only be used in cases where time and cost constraints do not allow for actual effective strength tests to be carried out. In most other cases the use of effective strength tests will provide a much more reliable and cost effective estimate of the strength properties of the soil in question.

FOUNDATION ANALYSIS AND DESIGN

JOESPH E. BOWLES, P.E., S.E.

TABLE 2-6
Representative values for angle of internal friction ϕ

Soil	Type of test*		
	Unconsolidated-undrained, U	Consolidated-undrained, CU	Consolidated-drained, CD
Gravel			
Medium size	40–55°		40–55°
Sandy	35–50°		35–50°
Sand			
Loose dry	28–34°		
Loose saturated	28–34°		
Dense dry	35–46°		43–50°
Dense saturated	1–2° less than dense dry		43–50°
Silt or silty sand			
Loose	20–22°		27–30°
Dense	25–30°		30–35°
Clay	0° if saturated	3–20°	20–42°

*See a laboratory manual on soil testing for a complete description of these tests, e.g., Bowles (1992).

Notes:

1. Use larger values as γ increases.
2. Use larger values for more angular particles.
3. Use larger values for well-graded sand and gravel mixtures (GW, SW).
4. Average values for gravels, 35–38°; sands, 32–34°.

Figure 2-35 Correlation between ϕ' and plasticity index I_p for normally consolidated (including marine) clays. Approximately 80 percent of data falls within one standard deviation. Only a few extreme scatter values are shown [Data from several sources: Ladd et al. (1977), Bjerrum and Simons (1960), Kanja and Wolie (1977), Olsen et al. (1986).]

2007 PAVEMENT DESIGN MANUAL
MINNESOTA DOT

Typical values of c and Φ are shown in Table 3-2.10.

Table 3-2.10. Typical cohesion and angle of internal friction values.

Mn/DOT Triangular Textural Classification	c Cohesion, kPa (psf)		Φ Angle of Internal Friction (degrees)
	Compacted	Saturated	
Gravel	0	0	> 37
Sand	0	0	37 – 38
	50 – 75	10- 20	
Loamy Sand	(1,000 - 1,500)	(200 – 400)	31 – 34
	50 – 75	10 - 20	
Sandy Loam	(1,000 - 1,500)	(200 – 400)	31 – 34
	60 – 90	10 - 20	
Loam	(1,300 - 1,800)	(200 – 400)	28 – 32
	60 – 90	10 - 20	
Silt Loam	(1,300 - 1,800)	(200 – 400)	25 – 32
	50 – 75	10 – 20	
Sandy Clay Loam	(1,000 - 1,500)	(200 – 400)	31 – 34
	60 – 105	10 -20	
Clay Loam	(1,300 - 2,200)	(200 – 400)	18 – 32
	60 – 105	10 - 20	
Silty Clay Loam	(1,300 - 2,200)	(200 – 400)	18 – 32
	50 – 75	10 - 20	
Sandy Clay	(1,000 - 1,500)	(200 – 400)	31 – 34
	90 – 105	10 -20	
Silty Clay	(1,800 - 2,200)	(200 – 400)	18 – 32
	90 – 105	10 - 20	
Clay	(1,800 - 2,200)	(200 – 400)	18 - 28

While these values can be used in pavement design, they are generally more applicable to slope stability and bearing capacity calculations. Therefore, these are most often used by the Foundations Unit, rather than at the District level.

The method of determining each of the above strength values is presented in Section 4-2.06.05.

4. Dynamic Cone Penetrometer (DCP). This test is a field procedure that can be used to determine the in-situ strength properties of base and subgrade soils. The DCP is currently used for quality assurance testing by Mn/DOT.
5. Elastic Modulus of Subgrade Reaction (k-value). The k-value is used as a primary input in concrete pavement design thickness models, and can only be measured using a field test on top of the subgrade. There is no direct laboratory procedure for determining the k-value.

The k-value can be estimated using any of the following methods:

- 1) Plate bearing tests on subgrade. A 762mm (30 in.) diameter plate is loaded to a given pressure at a specified rate and the resulting deflection is measured.

Sewer Investigation

To: Abby Mazza, City of Chicago Department of Fleet and Facility Management (2FM)

Cc: Carol Nissen, Tetra Tech, Inc. (Tetra Tech)

From: Kris Schnoes, Tetra Tech

Date: October 7, 2019

Subject: Summary of Sewer Cleanout and Investigation
Former Carnotite Reduction Company Site (Carnotite)
434 E. 26th Street
Chicago, IL

On July 31 and August 1, 2019, 2FM conducted sewer cleanout and investigation activities at the Carnotite site as required by the City of Chicago Department of Sewers prior to removal of sewers during remediation activities. 2FM conducted the sewer investigation in planned excavation areas to determine if any unknown connections to the combined sewers exist. Prior to televising the sewer, SET Environmental, Inc. (SET) cleaned the sewers by hydro-jetting and collected the sewer water and sludge in one 25-cubic yard vacuum box and five 300-gallon totes. The vacuum box and totes remained onsite for waste characterization prior to disposal. Once sewer cleanout was complete, Michel's Pipe Service conducted sewer televising activities. Tetra Tech was present during portions of the sewer cleanout and investigation. Also, Stan A. Huber Consultants, Inc. conducted radiation screening of the work areas and equipment during cleanout and investigation activities and screened all equipment in contact with potentially contaminated sewer water and sludge for free release after decontamination of the equipment was conducted, as necessary.

The sewer cleanout and investigation began in the south portion of the future remediation area, along 26th Street as it bends from a north-south orientation to an east-west orientation near the tennis courts. The investigation then continued to the north portion of the future remediation area, along 26th Street east of Martin Luther King Drive. The following information was documented during sewer televising activities:

- In the south area, the 12-inch vitrified clay pipe (VCP) sewer south of 26th Street was completely blocked with roots and debris.
- In the south area, the 12-inch VCP sewer north of 26th Street was inspected.
- In the north area, the 26th Street sewer was observed to be 12-inch diameter VCP east of the vegetated circular center median in 26th Street and 18-inch diameter VCP west of the vegetated median. A portion of the sewer pipe is corrugated metal pipe approximately 7 feet east of Martin Luther King Drive.
- In the north area, two previously unknown sewer connections to the north 26th Street sewer from the adjacent property to the north were discovered. One 10-inch VCP sewer drains the southwest parking lot located on the property north of the site. One 8-inch VCP sewer appears to connect to a combined sewer from the building located on the north property as well as drain storm water from the grass area located east of the existing driveway entering the north property from 26th Street.
- The 12-inch VCP sewer along north 26th Street was observed to be in poor condition in some locations, including a collapsed section in the eastern portion of 26th Street located about 90 feet west-southwest of the driveway entering the north property from 26th Street.

Hand drawn field maps prepared by Michel's are attached. Michel's report also included video and photos of the inspected sewer pipes.
