

Sustainable Transportation
The CTA plays an important role in reducing vehicle emissions in the Chicago region by replacing automobile trips, reducing traffic congestion and enabling compact development. By providing high-quality transit service, we strive to make regional transportation patterns more sustainable.

Efficient Facilities
The CTA is working to decrease the environmental impact of rail stations, offices and maintenance facilities.

Resource Recycling
The CTA purchases recycled materials where possible to reduce overall environmental impact. In addition, our internal recycling strategies and platform recycling bins help divert waste that would otherwise end up in landfills.

Chicago public transit plays an integral part in a greener, more sustainable community.

Multimodal Connections
The CTA coordinates planning efforts to link transit to complementary travel modes such as bicycling, car sharing and walking. We make every effort to provide additional travel options for customers that extend the reach and flexibility of our bus and rail service.

Clean Vehicles
The CTA is committed to the goal of cleaner air in the Chicago region. We've achieved significant emissions reductions from our rail, bus and support fleets through advanced vehicle technologies and alternative fuel sources.
