## I. INTRODUCTION

V3 Companies and Fish Transportation Group have been retained by Bally's Corporation to conduct a traffic impact study for a proposed temporary casino located at the Medinah Temple at 600 North Wabash Avenue. The site is currently vacant and provides approximately 130,000 square feet and is bound by Ontario Street to the north, Wabash Avenue to the east, Ohio Street to the south, and existing office and retail buildings and State Street to the west. A location map is included as Figure 1.

It is our understanding that the proposed temporary casino will be constructed within the existing building on the site and that no new buildings will be constructed. The program for the proposed redevelopment with the temporary casino will include up to a total of 1,100 gaming positions. Any restaurant, bar space, or retail would be ancillary to the casino and not be destination-type facilities. The conceptual site plan for the proposed temporary casino is included as Figure 2.

The purpose of this study is to evaluate the potential traffic impacts of the proposed temporary casino redevelopment. Traffic estimates are projected to 2023 which is when the temporary casino is projected to be open. The study includes the existing signalized intersections along State Street at Ontario Street and Ohio Street and along Wabash Avenue at Ontario Street and Ohio Street.

This report includes a description of existing conditions, data collection and capacity analysis, evaluation of data, and conclusions.

## II. PROJECT CONDITIONS

## Land Uses

The Medinah Temple is situated within an area of nearby dense commercial and residential uses including substantial amounts of entertainment and dining. As such, the temporary casino would be a very complimentary land use in the area generating a cross-traffic capture of patrons between the temporary casino and nearby restaurants, bars, and other entertainment establishments. The area is served by roadways and parking adjacent to the site as well as transit, pedestrian, and bicycle infrastructure.

## Roadway System

The characteristics of the roadways in the vicinity of the site are presented below. The existing lane configurations in the study area are illustrated in Figure 3.

## Roadway Descriptions

Ohio Street is a major arterial street that borders the site on the south. It operates one-way eastbound as the extension of the Interstate 94 off-ramp. Along the site frontage, it functionally operates with three travel lanes. The north curb lane has a small valet operation with the remainder marked as no parking. The south curb lane has a garage entrance (10 East Grand garage), valet operations, and a small amount of on-street parking at the east end near Wabash Avenue. At its intersection with Wabash Avenue and State Streets, Ohio Street is under traffic signal control. Immediately east of the intersection with Wabash Avenue is the entrance to the Rush/Ohio/Wabash parking garage which would allow for any valet operations to easily travel a few hundred feet to the east and enter the garage. CTA bus route 125 operates along Ohio Street. Ohio Street is under the jurisdiction of the Illinois Department of Transportation (IDOT) and has 11,800 vehicles per day near the site.

Wabash Avenue is a local street that borders the site on the east. It operates as a two-way street and is approximately 40 feet wide. It provides access to the main entrance of Medinah Temple and two supplemental entrance/exit doors at the north and south ends of the building. Along the site frontage it functionally operates with two travel lanes due to parked vehicles and valet along the street. At its signalized intersections with Ontario Street, it is wide enough to allow for two separate lanes. The east side of Wabash Avenue prohibits parking but there is valet at one restaurant. Of note is the exit for the Rush/Ohio/Wabash garage. Along the west side of the street (frontage of the site) parking is not allowed. Pedestrians are readily accommodated by wide sidewalks. Wabash Avenue is under the jurisdiction of the City of Chicago and has 8,900 vehicles per day along the site frontage.

Ontario Street is a major arterial street that borders the Site on the north. It operates one-way westbound and travels west to become the Interstate 94 on-ramp. Along the site frontage it functionally operates with three travel lanes. The north curb lane prohibits parking and has the
entrance/exit to the 10 East Ontario parking garage. The south curb lane has paybox parking but with restrictions from 7 am to 9 am and 4 pm to $6: 30 \mathrm{pm}$. Along the south side of the street (Site frontage), at the west end.is an entrance door and the loading bay, approximately 30 feet wide. Ontario Street is under the jurisdiction of IDOT and has a daily vehicle count of 10,710 vehicles per day.

State Street is a two-way arterial street immediately to the west of the site and operates with a single lane in each direction with exclusive left turn lanes at its intersections with both Ohio Street and Ontario Street. At these intersections, State Street is under traffic signal control. The uses that front State Street are not part of the Medinah Temple building and consist of small shops and offices. The east and west curb lanes consist of no parking zones, short loading zones and a bus stop for CTA route 36. State Street is under the jurisdiction of the City of Chicago and has 14,800 vehicles per day near the site.

## Intersection Descriptions

The intersection of State Street and Ontario Street is signalized and operates with a 75-second cycle length during the weekday evening pm peak period. The northbound approach of State Street consists of one left turn lane and one through lane while the southbound approach consists of one through lane and one shared through/right turn lane. The northbound left turn operates as a permitted left turn. The westbound approach of Ontario Street consists of one left turn/through lane, one through lane, and one through/right turn lane. There are existing pedestrian signals, sidewalk approaches, and crosswalks at each leg of the intersection.

The intersection of Wabash Avenue and Ontario Street is signalized and operates with a 75second cycle length during the weekday evening pm peak period. The northbound approach of State Street consists of one left turn/through lane and one through lane while the southbound approach consists of one through lane and one shared through/right turn lane. The northbound left turn operates as a protected and permitted left turn. The westbound approach of Ontario Street consists of one left turn/through lane, one through lane, and one through/right turn lane. There are existing pedestrian signals, sidewalk approaches, and crosswalks at each leg of the intersection.

The intersection of State Street and Ohio Street is signalized and operates with a 75 -second cycle length during the weekday evening pm peak period. The northbound approach of State Street consists of one shared through/right turn lane and the southbound approach consists of one left turn lane and one through lane. The southbound left turn operates as a permitted left turn. The eastbound approach of Ohio Street consists of one left turn/through lane, one through lane, and one through/right turn lane. There are existing pedestrian signals, sidewalk approaches, and crosswalks at each leg of the intersection.

The intersection of Wabash Avenue and Ohio Street is signalized and operates with a 75 -second cycle length during the weekday evening pm peak period. The northbound approach of Wabash Avenue consists of one through lane and one through/right turn lane while the southbound
approach consists of one left turn/through lane and one through lane. The southbound left turn operates as a permitted left turn. The eastbound approach of Ohio Street consists of one left turn/through lane, one through lane, and one through/right turn lane. There are existing pedestrian signals, sidewalk approaches, and crosswalks at each leg of the intersection.

## Transit and Non-Automotive Transportation System

A number of non-automotive modes of transportation are provided in the area, including bus and rail transit, pedestrian and bicycle infrastructure, and Divvy bikeshare stations. The characteristics of these non-auto modes of transportation are summarized below.

## Transit

The area is directly served by CTA bus route 125 which travels between Metra's Ogilvie and Union Stations downtown and Michigan Avenue along Ohio Street and Ontario Street. CTA bus route 36 operates along State Street to the west, route 22 operates along Dearborn Street and Clark Street to the west, routes 29 and 65 operate along Grand Avenue to the south, and numerous bus routes operate along Michigan Avenue to the east.

The CTA Red Line Grand Avenue station is located at State Street and Grand Avenue, a short two block walk from the site's front door. The existing transit network is illustrated in Figure 4.

The area is very pedestrian oriented with sidewalks along both sides of every street in the vicinity of the site. Additionally, all four signalized intersections around the site have marked crosswalks for each leg of the intersection. Pedestrian countdown timers are provided at the crossings with lead pedestrian intervals which provides additional pedestrian safety by allowing the pedestrian to enter the crosswalk prior to the green signal for vehicles.

The City of Chicago has been expanding the bicycle facilities within the city for a number of years. Dearborn Avenue, Grand Avenue, and Huron Street provide a buffered bike lane near the site. There are also several Divvy stations located within a several block areas of the site. The existing bicycle network is illustrated in Figure 5.

## Parking

While there is no on-site parking at the Medinah Temple, there are numerous parking options available around the site. In particular, there are parking garages in buildings directly adjacent to and within easy walking distance to the site that provide over 5,000 parking spaces as illustrated in Figure 6:

- 10 East Grand Avenue, 970 spaces
- 50 East Ohio Street, 1,025 spaces
- 10 East Ontario Street, 200 spaces
- 33 West Ontario Street, 356 spaces
- 516 North Rush Street, 200 spaces
- 430 North Rush Street, 218 spaces
- 540 North State Street, 314 spaces
- 10 West Grand Avenue, 1,000 spaces
- 401 North Wabash Avenue, 950 spaces

There is an Embassy Suites located on State Street to the west of the site that provides a valet station and a private parking garage with a driveway on State Street south of Ontario Street. Since this parking is for the hotel, it was not included in the available parking.

## Curb Space and Management

The existing curb space along the four roadways encompassing the site includes various parking and no parking limitations, bus stops, valet drop off/pick up zones, and loading zones. Figure 7 illustrates the existing curb management around the Medinah Temple.

The site frontage along Ohio Street and Wabash Avenue prohibits parking. Ontario Street allows parking with the exception of the peak hours from 7 to 9 am and 4 to $6: 30 \mathrm{pm}$ for most of the block except at the intersections and a small loading zone for the Medinah Temple. The north side of Ontario Street and the east side of Wabash Avenue prohibit parking. The south side of Ohio Street prohibits parking except for one space that allows parking outside of the peak hours and also includes a bus stop and loading zone. State Street provides numerous curb functions, including a valet drop off/pick up, a bus stop, and 30-minute loading zone along the east side of the street. The west side of the street includes no parking and loading zones, a taxi zone, and a valet drop off/pick up for the Embassy Suites hotel.

## Traffic Volumes

To assist in the evaluation of the traffic impact on the roadway system resulting from the proposed development, existing vehicular volumes were collected at the study area intersections.

Existing weekday peak hour traffic counts were collected on Thursday, May 12, 2022 from 5:00 pm to 9:00 pm at the intersections along State Street at Ontario Street and Ohio Street and along Wabash Avenue at Ontario Street and Ohio Street. The Friday casino peak hour counts were collected on Friday, May 13, 2022 from 5:00 pm to $9: 00 \mathrm{pm}$. The time periods of the traffic counts were selected to coincide with the typical peak hours of the traffic travelling on collector and arterial roadways and typical peak traffic generating hours of retail, commercial and residential uses as well as the typical casino operating peak hours.

The existing peak hour volumes are illustrated in Figure 8. A summary of the traffic volumes collected in fifteen-minute increments is provided in Appendix $A$.

## Proposed Development

It is our understanding that the Medinah Temple is currently vacant and will be reconstructed as a temporary casino and no additional buildings will be constructed or expanded. The program for the proposed redevelopment with the temporary casino will include a total of up to 1,100 gaming
positions. Any restaurant, bar space, or retail would be ancillary to the casino and not be destination-type facilities.

## Existing Field Observations

Field observations were conducted by senior staff from V3 Companies and Fish Transportation Group to observe traffic operations at the four signalized intersections, the existing operations of the curb space around the site, and to collect parking counts at the three parking garages directly adjacent to the site. Observations were conducted on Friday, August 26 during the commuter peak period and the casino peak period from prior to 4 pm to after 8 pm .

## Intersection Operations

The four intersections along State Street at Ontario Street and Ohio Street and along Wabash Avenue at Ontario Street and Ohio Street were observed during the commuter and casino peak hours on a clear Friday evening. During the observations, other intersections both upstream and downstream were also observed at the same time. The four signalized intersections operated efficiently, particularly for the eastbound movements on Ohio Street and the westbound movements on Ontario Street. The traffic signals in the eastbound and westbound directions are synchronized to improve traffic flow and the one-way operations of Ohio Street and Ontario Street with three travel lanes in each direction sufficiently accommodate the existing traffic demand. It appeared that vehicles would get the green signal from an upstream traffic signal and be able to travel through two signalized intersections before approaching a red signal. There were few times where traffic of any significance backed up on Ohio Street or Ontario Street due to traffic signal operations. While it is typical along roadways with multiple signalized intersections in an urban area to experience residual delays due to vehicles queuing, this was not observed along Ohio Street or Ontario Street.

With the two-way operations, typically only one travel lane in each direction, the left turns, and the short blocks between Ohio Street, and Ontario Street, the observed operations along State Street and Wabash Avenue appeared to have additional delays and queue but still operated sufficiently. The northbound and southbound movements had minimal residual delays at upstream signalized intersections that spilled over to the study intersections. The existing traffic signal timing plans accommodated the existing queues at the intersections and resulted in most vehicles being served by the green time of the signal.

During the field visit, there were minimal observations of pedestrians not obeying signals and causing additional delay for vehicles. Additionally, the existing curb operations with limited on street parking, valet drop off and pick up, rideshare drop off and pick up, loading zones, and bus stops had minimal impact on the vehicular operations of the traffic signals.

Operations at the intersection of Grand Avenue and State Street were also observed. This signalized intersection operated similarly with minimal residual delay and the existing traffic signal timing accommodating the vehicular demand in all directions.

## Parking Observations

The following are observations and parking count results at the three adjacent parking garages:

- ROW Parking garage, 50 East Ohio Street
- At 4 pm, approximately 265 spaces available
- At 5:45 pm, approximately 374 spaces available
- At 8 pm, approximately 449 spaces available
- Bottom two floors, First Class Parking, better lighting, indicators for open parking spaces
- General parking starts around level 4
- 10 East Grand Parking Garage
- Sign at entrance ramp indicating number of open spaces
- At 5:00 pm, 358 available spaces per illuminated sign
- At 5:33 pm, 379 available spaces per illuminated sign
- At 7:44 pm, 402 available spaces per illuminated sign
- 10 East Ontario Parking Garage
- "Full" sign at garage entrance/exit
- Over $5^{\text {th }}$ floor is private parking for Ontario Place
- About 26 spaces on $4^{\text {th }}$ floor reserved for Ontario Place
- At $5: 45 \mathrm{pm}, 95$ spaces available
- At 7:30 pm, 84 spaces available

Based on these parking counts, there are approximately 848 parking spaces available between 5:30 pm and 6 pm and approximately 935 parking spaces available between 7:30 and 8:00 pm. Additionally, there are several other parking garage options within a several block walk from the Medinah Temple.

It is estimated that the temporary casino will have a peak parking demand of approximately 500 parking spaces during typical operations, based on the following:

- 1,100 gaming positions with an anticipated maximum building occupancy of 1,500 individuals based on gaming position count and casino amenities
- 60 percent of casino patrons will drive, resulting in 900 patrons arriving by car
- Vehicle occupancy of approximately 2.0 people per car resulting in a parking demand of 450 spaces
- Most of the casino employees will travel by non-vehicular modes, such as transit, walking, and biking, and not require a parking space
- At peak times, it is anticipated that there will be 200 employees on site. Assuming that 25 percent drive results in an additional demand of 50 parking spaces
- Therefore, it is anticipated that the peak parking demand during normal operations will be 500 parking spaces.

Based on the completed parking observations, there is adequate parking in the area to accommodate this demand.

## III. TRAFFIC FORECASTS

## Project Traffic Volumes

## Trip Generation

The number of trips generated for the temporary casino site was estimated and reviewed for potential reductions for non-vehicular travel such as transit, walking, and capture between the casino and nearby restaurants and entertainment venues. Additionally, the number of taxi/rideshare trips was separately estimated as these trips generate entering and exiting trips for each pick up or drop off movement.

Trip generation for a proposed development is typically estimated using the Institute of Transportation Engineers (ITE) Trip Generation Manual, 10th Edition. ITE Land Use Code 473, Casino/Video Lottery Establishment is the closest land use with trip rates provided. However, the land use description explicitly states that the data provided does not include full-service casinos, those with food service, are not included. Therefore, it was determined that the ITE data provided is too limited and would not provide adequate estimates to the number of trips generated by the casino.

Therefore, a review of recent traffic studies was conducted for casinos within a similar urban context with nearby transit options to obtain trip rates during the casino peak periods. While several studies based the number of trips on the square footage of the casino, a majority of the studies developed trip rates based on the number of gaming positions. Gaming positions will be used as the independent variable to estimate the number of trips generated by the casino for this study.

Based upon the review of the various trip rates and discussions with the operator, it is estimated that the casino will generate trip rates of 0.42 trips per gaming position during the weekday evening commuter peak hour ( 4 pm to 6 pm ) and 0.47 trips per gaming position during the Friday evening casino peak hour ( 8 pm to 11 pm ). Using these trip rates and the 1,100 gaming positions proposed as part of this temporary entertainment redevelopment, the trip generation for the casino can be estimated.

It should be noted that the trip rate data collected was for a variety of casino sites, most of which had a number of ancillaries uses such as hotel, retail, restaurants, drinking places, conference center/meeting space, and theatres. For the purposes of this study, it was assumed that the trip rates presented above are only for the casino area and are likely a conservative estimate for the temporary casino since there are minimal ancillary uses.

A conservative ten percent reduction was applied for non-vehicular traffic, including transit, walking, and biking for casino patrons and employees. An additional ten percent reduction was applied for casino patrons that may already be in the area at other establishments, such as
restaurants and other entertainment venues that would not create an additional vehicular trip to and from the site.

It is assumed that 45 percent of the trips will be personal vehicles that will drive and park in one of the nearby parking garages and that 15 percent of trips will drive and utilize the valet parking along the Ohio Street frontage. Additionally, it is assumed that 15 percent of trips will use rideshare and five percent will use taxis. A taxi and rideshare trip actually generates two trips, one entering the site to drop off or pick up and one exiting the site; therefore, a redundancy rate was also added to account for the exiting trip. Typically, a redundancy reduction rate is applied to these trips assuming that the taxi or rideshare driver will also wait for or pick up another passenger leaving the site. However, to conduct a conservative analysis, a redundancy reduction rate was not used, assuming that all rideshare and taxi trips will generate two vehicular trips for each drop off or pick up trip.

After applying the reductions and the taxi/rideshare redundancy, it is estimated that the casino will generate 462 and 516 inbound and outbound trips during the weekday pm commuter peak hour and the Friday evening casino peak hour, respectively. Table 1 provides a summary of the trip generation for the casino.

Table 1: Trip Generation

| LAND USE | SIZE |  | Weekday PM Peak Hour (4-6 pm) |  |  | Friday Casino Peak Hour (8-11 pm) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | In | Out | Total | In | Out | Total |
| Casino | 1,100 | Gaming Positions | 245 | 217 | 462 | 238 | 279 | 517 |
| Local Area Capture Reduction (10\%) |  |  | -25 | -21 | -46 | -24 | -28 | -52 |
| Non-Auto Trip Reduction (10\%) |  |  | -25 | -21 | -46 | -24 | -28 | -52 |
| Subtotal Trips Generated |  |  | 195 | 175 | 370 | 190 | 223 | 413 |
| Self-Drive and Park (45\%) |  |  | 110 | 98 | 208 | 107 | 126 | 233 |
| Self-Drive and Valet (15\%) |  |  | 37 | 33 | 70 | 36 | 41 | 77 |
| Taxi (5\%) |  |  | 12 | 11 | 23 | 11 | 15 | 26 |
| Rideshare (15\%) |  |  | 37 | 32 | 69 | 36 | 41 | 77 |
| Taxi/Rideshare Redundancy |  |  | 43 | 49 | 92 | 56 | 47 | 103 |
| Total New Vehicle Trips |  |  | 239 | 223 | 462 | 246 | 270 | 516 |

## Site Access

Vehicular access to the site is anticipated to be primarily via Lake Shore Drive and other local streets for most local and City trips and via I-90/I-94 and the Ohio Street feeder ramp for longer distance trips. Appendix B illustrates the likely travel patterns to and from the temporary casino for vehicle trips using l-90/I-94 and Lake Shore Drive.

## Trip Distribution and Assignment

The direction from which traffic approaches and departs a site is a function of numerous variables, including location of residences, location of employment centers, location of commercial/retail centers, available roadway systems, location and number of access points, and level of congestion on adjacent road systems. The directional distribution of traffic generated by the site is assigned differently for self-drive/park trips and taxi/rideshare trips.

The directional distribution of all vehicle trips is assigned primarily based on existing traffic patterns in the area, with adjustments made for the likely sources of trips to and from the temporary casino and the one-way roadway network. Additionally, a market study was completed that forecasted locations of revenue sources around the Chicagoland area.

The highest percentage of self-drive/park trips is assigned Ohio Street and Ontario Street as these are categorized as principal arterial roadways and provide direct east/west access to the regional freeway network. A smaller portion of trips are assigned to the south on State Street, which provides connectivity to several residential, commercial/retail, and entertainment areas. The taxi/rideshare trips are distributed more evenly throughout the roadway network as drivers will be traveling to the site from various areas of the city and departing throughout the area looking for the next fare.

Table 2 provides a summary of the trip distribution for the self-drive and taxi traffic.
Table 2: Trip Distribution

| Direction | Self-Drive/Park <br> Distribution | Taxi/Rideshare <br> Distribution |
| :--- | :---: | :---: |
| North: State Street \& Wabash Avenue | $5 \%$ | $30 \%$ |
| East: Ontario Street \& Ohio Street | $20 \%$ | $20 \%$ |
| South: State Street \& Wabash Avenue | $10 \%$ | $30 \%$ |
| West: Ontario Street \& Ohio Street | $65 \%$ | $20 \%$ |

The directional distributions and assignment of new self-drive and valet traffic volumes are illustrated in Figure 9. For this analysis, it was assumed that all drop off valet operations would occur at the Ohio Street valet area per the trip distribution, travel through the Wabash Avenue intersection, and enter the garage. The pick-up trip would exit the garage at the Wabash Avenue garage driveway, travel around the block to the valet area, pick up the patron, and then exit the study area per the trip distribution.

The directional distributions and assignment of new self-drive and park traffic volume is illustrated in Figure 10. For this analysis, it was assumed that a majority of eastbound Ohio Street and southbound and northbound State Street traffic would us the 50 East Ohio Street garage (50 percent) and a portion would use the 10 East Grand Avenue garage ( 30 percent) which has an entrance along Ohio Street east of State Street. The westbound Ontario Street traffic is assumed to park in the 10 East Ontario Street garage ( 20 percent). It should be noted that vehicles entering
the 10 East Grand Avenue parking garage would have to exit at the Grand Avenue driveway, resulting in additional westbound traffic along Grand Avenue. The additional traffic is projected to be minimal, with an additional 29 vehicles during the weekday pm peak hour (approximately one every two minutes) and 38 vehicles during the Friday night casino peak hour (approximately one every 1.5 minutes) being added to the intersection at State Street.

The directional distributions and assignment of new rideshare and taxi traffic volume traffic volume is illustrated in Figure 11. While the operations of taxi and rideshare drop off and pick up trips are challenging to force at a certain location due to driver and patron tendencies, it was assumed that all rideshare and taxi trips will circulate through the intersections per the inbound trip distribution to the drop off curb along Ohio Street and then exit in the eastbound direction per the outbound trip distribution. It is assumed that all rideshare and taxi trips will only drop off patrons and not pick up another fare while waiting on the curb.

The total projects trips are added to the existing traffic volumes to obtain the future with project traffic volumes for the study area intersections. Future with project traffic volumes are depicted in Figure 12.

## IV. TRAFFIC ANALYSIS

## Capacity Analysis

The operation of a facility is evaluated based on level of service (LOS) calculations obtained by analytical methods defined in the Transportation Research Board's Highway Capacity Manual (HCM), 6th Edition. The concept of LOS is defined as a quality measure describing operational conditions within a traffic stream, generally in terms of such service measures as speed and travel time, freedom to maneuver, traffic interruptions, and comfort and convenience.

There are six LOS letter designations, from A to $F$, with LOS A representing the best operating conditions and LOS F the worst.

The LOS of an intersection is based on the average control delay per vehicle. For a signalized intersection, the delay is calculated for each lane group and then aggregated for each approach and for the intersection as a whole. Generally, the LOS is reported for the overall intersection. For an unsignalized intersection, the delay is only calculated and reported for each minor movement. An overall intersection LOS is not calculated.

There are different LOS criteria for signalized and unsignalized intersections primarily due to driver perceptions of transportation facilities. The perception is that a signalized intersection is expected to carry higher traffic volumes and experience a greater average delay than an unsignalized intersection. The LOS criteria for signalized and unsignalized intersections are provided in Table 3.

Table 3: Level of Service Definitions for Signalized and Unsignalized Intersections

| Level of Service | Signalized Intersection <br> Control Delay <br> (seconds/vehicle) | Unsignalized Intersection <br> Control Delay <br> (seconds/vehicle) |
| :---: | :---: | :---: |
| A | $\leq 10$ | $\leq 10.0$ |
| B | $>10.0$ and $\leq 20.0$ | $>10.0$ and $\leq 15.0$ |
| C | $>20.0$ and $\leq 35.0$ | $>15.0$ and $\leq 25.0$ |
| D | $>35.0$ and $\leq 55.0$ | $>25.0$ and $\leq 35.0$ |
| E | $>55.0$ and $\leq 80.0$ | $>35.0$ and $\leq 50.0$ |
| F | $>80.0$ | $>50.0$ |

Source: Transportation Research Board, Highway Capacity Manual $6^{\text {th }}$ Edition, National Research Council, 2016.

Typically, various state and local governments adopt standards varying between LOS C and LOS $E$, depending on the area's size and roadway characteristics.

The study area consists of the signalized intersections along Ontario Street at State Street and Wabash Avenue and along Ohio Street at State Street and Wabash Avenue. A capacity analysis
was performed with Synchro 11. Models were created for the weekday pm commuter peak hour and the Friday pm casino peak hour for the existing and future with project scenarios.

The capacity analysis results at the signalized intersections are summarized in Table 4. The traffic signal timing schedule were obtained from the City of Chicago Department of Transportation (CDOT) and utilized for this analysis and are included in Appendix A. Supporting capacity analysis worksheets for the existing and future with project scenarios are provided in Appendix C and D, respectively.

Table 4: Capacity Analysis of Signalized Intersections

| Intersection | Peak Hour | Scenario | Eastbound |  | Westbound |  | Northbound |  | Southbound |  | Intersection |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

At each signalized intersection during the two peak hours, each approach currently operates at LOS C or better and the overall intersections also operate at LOS C or better. It should be noted that the traffic model evaluates the vehicular volumes by approach and movement, the intersection lane configuration, the number of pedestrian crossings in conflict with turning vehicles, and the traffic signal phasing and timing plan for each intersection. The traffic model does not take into account the residual vehicle queues for each movement from downstream intersections not in the traffic model or additional delays created from double parked vehicles and loading/unloading trucks.

The addition of the projected temporary casino trips during the weekday pm commuter peak hour and the Friday pm casino peak hour result in slight increases in delay but all approaches and the overall intersections still operating at LOS C or better. Similar to the existing analysis, the traffic
model evaluates the traffic volumes by movement, the intersection lane configuration, pedestrian crossings, and signal timings.

## Proposed Curb Management Plan

## Valet Parking

In addition to parking at the adjacent garages or using a non-automotive option to access the temporary casino, valet parking is an important function for casinos. There are currently several valet drop off/pick up zones in the immediate area around the Medinah Temple, including at the mid-block location on Ohio Street between State Street and Wabash Avenue. This section of Ohio Street currently prohibits parking.

There were several options that were evaluated for the potential location of the valet drop off and pick up area:

- On street along Ohio Street adjacent to the Medinah Temple
- On street along Ohio Street west of the driveway to the 50 East Ohio Street parking garage
- On street adjacent to the driveways accessing the 10 East Ontario Street or 10 East Grand Avenue parking garages
- Within a parking garage at the entrance/exit driveways
- Within a parking garage parking area

Valet parking cannot occur at the street level adjacent to the 50 East Ohio Street or 10 East Ontario Street parking garages due to lack of curb space for drop off and pick up operations. Backups could occur at these locations and backup into signalized intersections impacting pedestrian crossings and vehicle operations. Similarly, there is a bus stop adjacent to the driveway on Ohio Street for the entrance ramp to the 10 East Grand Avenue parking garage.

Valet parking cannot occur at entrances and exits to the parking garages in vicinity of Medinah Temple due to gates immediately at the street level entrance (10 East Ontario Garage) or steep ramps up and down ( 50 East Ohio Street, 10 East Grand Avenue parking garages) directly adjacent to the roadways.

If valet parking within the garage, operations of the valet drop off and pick up would have to occur within existing parking spaces adjacent to the garage driveways which results in a loss of parking for the garage. Additionally, while parking in the garage may only be available at the higher floors, there is less benefit for patron valet as they will still have to walk from the garage to the casino. Additionally, it is our understanding that the Illinois Gaming Board requires valet operators to be licensed, so casino valet personnel will be operating within a private garage, which will have liability and insurance challenges.

Therefore, it is recommended that valet operations be provided along the Ohio Street frontage adjacent to the Medinah Temple. An existing valet area already exists for the Ivy Room directly west of the casino. Including this existing valet area, there is approximately 150 feet of street
frontage for valet drop off and pick up, which can accommodate six to eight vehicles. Based on the projected 70 weekday pm peak hour ( 37 drop off, 33 pick-up) and 77 Friday night casino peak hour ( 33 drop off, 41 pick-up) valet movements, it is anticipated that this area should be able to accommodate that demand. Drop off should be quick and any delay for pick-ups will be for patrons waiting on the curb, not vehicles queueing on the street. Additionally, the valet operators will be instructed to not allow parking or staging within this area.

The following recommendations must be implemented to provide adequate valet operations along Ohio Street:

- Vehicles arriving for valet drop off or pick up shall not be double-parked, staged, or loaded in/out from any travel lane
- Vehicles arriving for valet drop off shall not dwell unattended at the curb for more than 60 seconds
- All parking of valet vehicles shall occur in off-street garages/lots. Vehicles shall not be parked or staged by valet attendants at any location on the public way, including but not limited to the street frontages near the site (e.g., south side of Ohio Street, east side of Wabash Avenue, etc.).
- The valet operator shall develop a monitoring and compliance plan to these terms with regular reporting to the City of Chicago on adherence to these terms. The valet operator shall promptly notify the City of any recurring operational issues including but not limited to queue spillback of vehicles arriving for valet drop off.
- If the valet operator is found in non-compliance of the conditions, valet operation will be suspended. Adequate opportunity to address the issue(s) will be granted twice before the ability to valet on-street will be revoked.

While Bally's has not yet determined parking pricing for valet operations, they would be open to discussions with CDOT staff about developing a pricing differential between self-park and valet to encourage self-park to minimize the curbside valet volumes.

It is recommended that the parking garage at 50 East Ohio Street be utilized for valet parking operations. After dropping off a vehicle at the valet zone, it can continue to travel east through the Wabash Avenue intersection and enter the parking garage via a left turn and park within the garage. To pick up the casino patron, the vehicle can exit the garage at the Wabash Avenue driveway, travel around the block, and pick up the patron at the same location.

## Charter Bus and Shuttle

Additionally, patrons may visit the temporary casino via charter bus or smaller-type shuttle bus. It is recommended that the curb space along the west side Wabash Avenue be utilized for loading and unloading charter and shuttle buses due to the primary building entrance and two other building entrances along Wabash Avenue. There is approximately 180 feet of available curb space that currently prohibits parking that could be utilized for the short-term bus loading and unloading. This curb space would provide access for approximately four to five charter buses or more shuttle buses. After unloading patrons, the charter buses could then travel to a Cityapproved charter bus parking area or could also park at the south end of the Tribune Freedom Plaza via Grand Avenue, if allowed. While the exact number of arriving buses at any given time
is difficult to quantify as local charters may not coordinate with the casino, this entire Wabash Avenue frontage should provide adequate area for these operations.

The recommended bus routing from I-94 would be Ohio Street to Rush Street to Ontario Street to Wabash Avenue. Similarly, the routing to the Tribune Freedom Plaza or to I-94 would be westbound Grand Avenue. It is recommended that Bally's work with the drivers and companies of known bus operators and to provide this information on the casino website.

## Taxi / Rideshare

Taxi and rideshare/transportation network providers (TNP's), such as Lyft and Uber, are recommended to use the curb space along Ohio Street west of the valet parking area. This area provides approximately 100 feet for drop off and pick up activities. Vehicles should not linger in the zone to maximize efficiency of the curb. As previously stated, the operations of taxi and rideshare drop off and pick up trips are challenging to force at a certain location due to driver and patron tendencies. It is likely that rideshare and taxi patrons will be dropped off or picked up along the adjacent roadways around the Medinah Temple.

## Traffic Control Aides

In order to provide safe and efficient access for casino patrons as well as to limit any roadway impacts to the local businesses and neighborhood, it is recommended that Traffic Control Aides (TCA's) be present on site during the peak casino periods to keep traffic flowing around the site and limit double parking along the roadways. The specific number and location of the TCA's should be coordinated with the Chicago Department of Transportation and the Office of Emergency Management and Communications (OEMC).

The roles of the TCA's are to enforce the no parking rules, keep rideshare and taxi from backing up onto the street, enforce no double parking, move pedestrians across the streets during the pedestrian phases, and minimize dwell time and delays for buses, valet, and rideshare vehicles. It is recommended that the operations of the TCA's be continuously reviewed to verify that adequate TCA coverage is provided to efficiently serve all casino patrons and adjacent modes of transportation.

Figure 13 illustrates the proposed curb management plan around the Medinah Temple site.

## Opening Conditions

It is anticipated that the first months of the temporary casino opening will generate more peak patron and vehicular activity than during the typical casino operations over the long run. The casino opening will be critical to the perceived access to the site so is critical to everyone.

Prior to opening the temporary casino, Bally's will coordinate with the Office of Emergency Management and Communications (OEMC), CDOT, and other stakeholders to develop a transportation management strategy that addresses elevated attendance and traffic during the initial weeks of the casino being open. Potential strategies that may be considered include:

- Soft opening with controlled invites
- Enhanced promotion of walk, bike, and transit access
- An expanded radius of actively managed intersections with traffic control personnel
- Variable message signs directing approaching traffic to alternate parking locations if the normal garages are full
- Alternate TNP/rideshare and bus pick-up locations further from the site using geofencing

Traffic conditions will be monitored during this initial period and adjusted accordingly as traffic activity at the casino normalizes.

## V. CONCLUSIONS

The purpose of this report is to conduct a traffic impact study for the temporary casino located at the Medinah Temple at 600 North Wabash Avenue. The site is currently vacant and provides approximately 130,000 square feet and is bound by Ontario Street to the north, Wabash Avenue to the east, Ohio Street to the south, and existing office and retail buildings and State Street to the west. The study includes the existing signalized intersections along State Street at Ontario Street and Ohio Street and along Wabash Avenue at Ontario Street and Ohio Street.

It is our understanding that the proposed temporary casino will be constructed within the existing building on the site and that no new buildings will be constructed. The program for the proposed redevelopment with the temporary casino will include up to a total of 1,100 gaming positions. Any restaurant, bar space, or retail would be ancillary to the casino and not be destination-type facilities.

The Medinah Temple is situated within an area of nearby dense commercial and residential uses including substantial amounts of entertainment and dining. As such, the temporary casino would be a very complimentary land use in the area generating a cross-traffic capture of patrons between the temporary casino and nearby restaurants, bars, and other entertainment establishments. The area is served by roadways and parking adjacent to the site as well as transit, pedestrian, and bicycle infrastructure.

A traffic model was created using Synchro 11 to conduct a capacity analysis at the study area intersections. Traffic models were created for the weekday pm commuter peak hour and the Friday evening pm casino peak hour. Based on the results of the capacity analysis, the signalized intersections and each approach operate at LOS C or better for the existing and future with project scenarios for each peak hour evaluated. It should be noted that the traffic model evaluates the vehicular volumes by approach and movement, the intersection lane configuration, the number of pedestrian crossings in conflict with turning vehicles, and the traffic signal phasing and timing plan for each intersection. The traffic model does not take into account the residual vehicle queues for each movement or additional delays created from double parked vehicles and loading/unloading trucks.

In addition to parking at the adjacent garages or using a non-automotive option to access the temporary casino, valet parking is an important function for casinos. There were several options that were evaluated for the potential location of the valet drop off and pick up area, including on street and within adjacent parking garages. It is recommended that valet operations be provided along the Ohio Street frontage adjacent to the Medinah Temple. An existing valet area already exists for the Ivy Room directly west of the casino. Including this existing valet area, there is approximately 150 feet of street frontage for valet drop off and pick up, which can accommodate six to eight vehicles. Based on the projected 70 weekday pm peak hour ( 37 drop off, 33 pick-up) and 77 Friday night casino peak hour ( 33 drop off, 41 pick-up) valet movements, it is anticipated that this area should be able to accommodate that demand. Drop off should be quick and any
delay for pick-ups will be for patrons waiting on the curb, not vehicles queueing on the street. Additionally, the valet operators will be instructed to not allow parking or staging within this area.

While Bally's has not yet determined parking pricing for valet operations, they would be open to discussions with CDOT staff about developing a pricing differential between self-park and valet to encourage self-park to minimize the curbside valet volumes.

It is recommended that the parking garage at 50 East Ohio Street be utilized for valet parking operations. After dropping off a vehicle at the valet zone, it can continue to travel east through the Wabash Avenue intersection and enter the parking garage via a left turn and park within the garage. To pick up the casino patron, the vehicle can exit the garage at the Wabash Avenue driveway, travel around the block, and pick up the patron at the same location.

It is recommended that the curb space along the west side Wabash Avenue be utilized for loading and unloading charter and shuttle buses due to the primary building entrance and two other building entrances along Wabash Avenue. There is approximately 180 feet of available curb space that currently prohibits parking that could be utilized for the short-term bus loading and unloading. This curb space would provide access for approximately four to five charter buses or more shuttle buses. The recommended bus routing from I-94 would be Ohio Street to Rush Street to Ontario Street to Wabash Avenue. Similarly, the routing to the Tribune Freedom Plaza or to I94 would be westbound Grand Avenue. It is recommended that Bally's work with the drivers and companies of known bus operators and to provide this information on the casino website.

Taxi and rideshare/transportation network providers (TNP's), such as Lyft and Uber, are recommended to use the curb space along Ohio Street west of the valet parking area. This area provides approximately 100 feet for drop off and pick up activities. Vehicles should not linger in the zone to maximize efficiency of the curb. The operations of taxi and rideshare drop off and pick up trips are challenging to force at a certain location due to driver and patron tendencies. It is likely that rideshare and taxi patrons will be dropped off or picked up along the adjacent roadways around the Medinah Temple.

In order to provide safe and efficient access for casino patrons as well as to limit any roadway impacts to the local businesses and neighborhood, it is recommended that Traffic Control Aides (TCA's) be present on site during the peak casino periods to keep traffic flowing around the site and limit double parking along the roadways.

The roles of the TCA's are to enforce the no parking rules, keep rideshare and taxi from backing up onto the street, enforce no double parking, move pedestrians across the streets during the pedestrian phases, and minimize dwell time and delays for buses, valet, and rideshare vehicles. It is recommended that the operations of the TCA's be continuously reviewed to verify that adequate TCA coverage is provided to efficiently serve all casino patrons and adjacent modes of transportation.
