COVID-19 Therapeutics

If you test positive for COVID-19, including on a home test, and are 65 years or older or have an underlying condition that puts you at high risk of severe COVID-19 outcomes, contact a healthcare provider right away to discuss treatment options. **Treatments must be taken soon after the start of your symptoms to help reduce your risk of hospitalization and death.**

If you don't have a healthcare provider, go to **aspr.hhs.gov/TestToTreat** or call **1-800-232-0233** (TTY 1-888-720-7489, Disability Information and Access line 1-888-677-1199) to find a community health center or pharmacy clinic that can evaluate you and, if you're eligible, connect you to treatment.

COVID-19 treatments include:

ORAL AND IV ANTIVIRALS Paxlovid and molnupiravir are pills you take by mouth and must be taken within 5 days of the start of your symptoms. Remdesivir is given through a vein by IV infusion and must be given within 7 days of the start of your symptoms.

MONOCLONAL ANTIBODIES (Bebtelovimab) are laboratory-made proteins that mimic the immune system's ability to fight off the virus. They are given through a vein by IV infusion and must be given within 7 days of the start of your symptoms.

PRE-EXPOSURE PROPHYLAXIS Evusheld is a preventive monoclonal antibody therapy for those not infected with COVID-19 and with moderate to severe immune compromise, or for whom vaccination is not recommended due to a history of severe adverse reactions (e.g., severe allergic reactions) to the COVID-19 vaccines.
