What is the risk?
Currently, the risk of influenza infection is low. Vaccination is the best way to protect against influenza infection and all Chicagoans aged six months and older are encouraged to get vaccinated. Chicagoans should ask their healthcare provider or pharmacist about vaccine availability. For those without a healthcare provider or whose healthcare providers do not have the influenza vaccine, a schedule of City of Chicago influenza vaccine clinics is available on the City website and by calling 311. To locate the closest City of Chicago clinic or retail pharmacy, go to www.chicagoflushots.org.

Are severe cases of influenza occurring?
The Illinois Department of Public Health (IDPH) has issued influenza testing and reporting guidance. Suspected novel and variant influenza, pediatric influenza-associated deaths, influenza-associated ICU hospitalizations and outbreaks of influenza-like illness in a congregate setting should all be reported to CDPH via IN-EDSS. Since September 29, 2013 (week 40), CDPH has not received any reports of these types of influenza cases.

How much influenza-like illness is occurring?
CDPH receives data from over 50 surveillance sites across Chicago, which report the total number of patient visits seen weekly, and of those visits, the number with influenza-like illness (ILI) (i.e., fever of 100°F or greater, with cough or sore throat). All hospitals in Chicago that provide emergent care are required to report on a weekly basis the total number of emergency department visits, and of those visits, the number with ILI. For the week of October 20-26, 2013 (week 43), with 14 hospitals reporting, 1.8% of emergency department visits were due to ILI. Figure 1 shows Chicago emergency department ILI activity for the current season and for the previous three seasons.

ESSENCE is an electronic syndromic surveillance system that utilizes emergency department chief complaint data submitted daily by participating Chicago hospitals. ILI activity is determined solely based on the patient’s chief complaint and does not take into account the entire medical record, as the ILI activity reported in Figure 2 does.

Currently, 10 Chicago hospitals submit data to ESSENCE. Figure 2 shows the percent of the total emergency department visits due to ILI for pediatric patients (3.2%) and adult patients (<1%) for the week of October 20-26, 2013 plus the ILI activity by age group for the previous season.
Several outpatient clinics and hospital emergency departments throughout Chicago participate in CDC’s Influenza-like Illness Surveillance Network (ILINet) by reporting on the number of patients with ILI seen weekly. From October 20-26, 2013, with 46 facilities reporting, 2.7% of outpatient visits were due to influenza-like illness (Figure 3).

Which influenza strains are circulating?
Data on influenza virus test results are reported by Chicago laboratories performing influenza subtyping. For the week of October 20-26, 2013, with 5 laboratories reporting, 1 of the 251 (<1%) specimens tested for influenza was positive for influenza A (no subtyping performed). Table 1 shows the total number of specimens tested for influenza (and other respiratory viruses) so far this season and the number positive compared to the same time period last season.

Where can I get more information?
The Centers for Disease Control and Prevention’s FluView’s report provides national updates and trends related to the intensity of influenza activity across the United States, as well as detailed information on antiviral resistance, severity of illness, and other topics. Updates specific to Illinois and Suburban Cook County are also available online. Current and archived issues of the Chicago Flu Update can be found on the CDPH website section Current Flu Situation in Chicago. The Metropolitan Chicago Healthcare Council (MCHC) and CDPH recently released “Stop the Spread: A Health Care Guide to Influenza Preparedness.” This report provides an overview of influenza, its impact on public health and how hospitals can prepare for, mitigate the impact of and respond to influenza infections and outbreaks.

National Snapshot (October 20-26, 2013)
Viral Surveillance: Of 3,241 specimens tested and reported by U.S. World Health Organization (WHO) and National Respiratory and Enteric Virus Surveillance System (NREVSS) collaborating laboratories during week 43, 145 (4.5%) were positive for influenza.

Pneumonia and Influenza Mortality: The proportion of deaths attributed to pneumonia and influenza (P&I) was below the epidemic threshold.

Influenza-Associated Pediatric Deaths: No influenza-associated pediatric deaths were reported.

Outpatient Influenza Surveillance: The proportion of outpatient visits for influenza-like illness (ILI) was 1.2%, below the national baseline of 2.0%. All 10 regions reported ILI below region-specific baseline levels. Three states experienced low ILI activity, 47 states and New York City experienced minimal ILI activity and the District of Columbia had insufficient data.

Geographic Spread of Influenza: The geographic spread of influenza in Puerto Rico and one state was reported as regional; 4 states reported local influenza activity; Guam and 30 states reported sporadic influenza activity; 15 states reported no influenza activity, and the District of Columbia and the U.S. Virgin Islands did not report.

Figure 3. Percent of medically attended visits attributed to influenza-like illness as reported by ILINet facilities, Chicago, by week, for current season (2013-2014) and previous three influenza seasons, October-May.
